SECTION A: SMALL PROJECT STORMWATER SITE PLAN/REPORT

Narrative and Plan Submittal

Instructions: This is a template for a simplified Stormwater Report. This form or an equivalent must accompany your Building Permit Application if the answer is "Yes" to each statement below. If "No" is the answer to one or more of the statements below, a full Drainage Report is required and the project does not qualify for use of the Small Project Stormwater Site Plan/Report template.

Select "yes" or "no" for each statement below. Answer "yes" if the statement accurately describes your project.

Yes	No	Statement
		This project disturbs less than 1 acre and is not part of a larger common plan of development.
		This project converts less than 3/4 acre to lawn or landscape areas.
		This project will create, add, or replace (in any combination) 2,000 square feet or greater, but less than 5,000 square feet, of new plus replaced hard surface OR will have a land disturbing activity of 7,000 square feet or greater OR will result in a net increase of impervious surface of 500 square feet or greater.
		This project will not adversely impact a wetland, stream, water of the state, or change a natural drainage course.

Basic Project Information

Project Name:	
Site Address:	
Total Lot Size:	
Total Proposed Area to be Disturbed (including stockpile area):	sq ft
Total Volume of Proposed Cut and Fill:	sq ft
Total Proposed New Hard Surface Area:	sq ft
Total Proposed Replaced Hard Surface Area:	sq ft
Total Proposed Converted Pervious Surface Area	sq ft
(Native vegetation to lawn or landscape):	<u> </u>
Net Increase in Impervious Surface:	sq ft

Minimum Requirement #1 : Preparation of Stormwater Site Plan

Written Project Description:

Calculate new or replaced areas by surface type:

Lawn or Landscape Areas:		sq ft	Roof Area:	sq ft
Other Hard Surface Areas:				
Driveway:	sq_ft Patio:		sq ft Sidewalk:	sq ft
Parking Lot:	sq ft Other: _		sq ft	

Attach Drainage Plan

Drainage Plan shall include the following:

- <u>Scaled drawing</u> with slopes, lot lines, any public-right-of-way and any easements, location of each on-site stormwater management BMP selected above and the areas served by them, buildings, roads, parking lots, driveways, landscape features, and areas of disturbed soils to be amended.
- The scaled drawing must be suitable to serve as a recordable document that will be attached to the property deed for each lot that includes on-site BMPs. Document submittal must follow the "Standard Formatting Requirements for Recording Documents" per King County: <u>www.kingcounty.gov/depts/records-licensing/recorders-office/recordingdocuments.aspx</u>
- Identify design details and maintenance instructions for each on-site BMP, and attach them to this Small Project Stormwater Site Plan/Report.

SECTION A: SMALL PROJECT STORMWATER SITE PLAN/REPORT

Minimum Requirement #2 : Construction Stormwater Pollution Prevention

Complete Section B of this submittal package: Construction Stormwater Pollution Prevention Plan Narrative (SWPPP)

Attach construction SWPPP see civil sheet C1.0 Erosion Control Plan

Minimum Requirement #3 : Source Control of Pollution

This section contains practices and procedures to reduce the release of pollutants. Provide a description of all known, available and reasonable source control BMPs that will be, or are anticipated to be, used at this location to prevent stormwater from coming into contact with pollutants. Additional BMPs are found in Volume IV of the 2014 Stormwater Management Manual for Western Washington (SWMMWW).

Check the BMPs you will use:

BMP S411 for Landscaping and Lawn/ Vegetation Management Operational practices for sites with landscaping

BMP S421 for Parking and Storage of Vehicles. Public and commercial parking lots can be sources of suspended solids, metals, or toxic hydrocarbons such oils and greases.

BMP S433 for Pools, Spas, Hot Tubs, Fountains Discharge from pools, hot tubs, and fountains can degrade ambient water quality. Routine maintenance activities generate a variety of wastes. Direct disposal of these waters to drainage system and waters of the state are not permitted without prior treatment and approval.

Other BMPs found in Volume IV of SWMMWW applicable to project:

SECTION A: SMALL PROJECT STORMWATER SITE PLAN/REPORT

Minimum Requirement #4 : Preservation of Natural Drainage Systems

Natural drainage patterns shall be maintained and discharges from the project site shall occur at the natural location, to the maximum extent practicable. All outfalls require energy dissipation.

Choose the option below that best describes your project:

This site has existing drainage systems or outfalls. These items are shown on the Drainage Plan. Include the following items on the Drainage Plan:

- Pipe invert elevations, slopes, cover, and material
- Locations, grades, and direction of flow in ditches and swales, culverts, and pipes

Describe how these systems will be preserved:

This site does not have any existing drainage systems or outfalls.

SECTION A: SMALL PROJECT STORMWATER SITE PLAN/REPORT

Minimum Requirement #5 : On-site Stormwater Management

All projects meeting the thresholds for this Small Project Stormwater Report shall employ on-site stormwater management BMPs (See Small Project Stormwater Requirements Tip Sheet) to infiltrate, disperse, and retain stormwater runoff on-site to the extent feasible without causing flooding or erosion impacts.

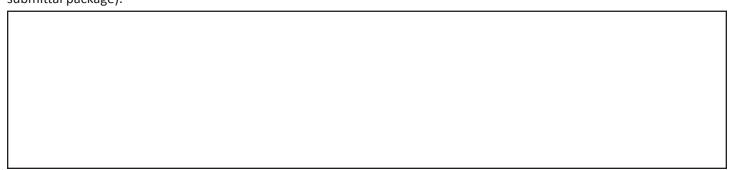

List #1

For each category select the *first* feasible item on the list below. Document your justification for each infeasible BMP in Section C of this submittal package.

Check <u>one</u> option for <u>each category</u> below:

Lav	vn and Landscape Areas
	My project does not have Lawn or Landscape areas
	Post-construction soil quality and depth
	Post-construction soil quality and depth is infeasible (see Section C of this submittal package)
Roo	ofs
	My project does not have <i>Roof</i> areas
	1. Full dispersion or downspout full infiltration
	2. Rain garden or bioretention
	3. Downspout dispersion system Measured Infiltration Rate: in/ hr
	4. Perforated stub-ex-connections
	5. On-site detention system or fee-in-lieu of on-site detention authorized by the City Engineer (applicable if options #1-4 are infeasible and drainage from the site will be discharged to a storm or surface water system that includes a watercourse or there is a capacity constraint in the system)
	6. No Roof BMP (applicable if options #1-4 are infeasible and on-site detention is not required)

If #5 or #6 is selected, briefly describe why no Roof BMP is feasible (include detailed information in Section C of this submittal package):

SECTION A: SMALL PROJECT STORMWATER SITE PLAN/REPORT

Minimum Requirement #5 : On-site Stormwater Management (cont.)

 Other Hard Surfaces (such as driveway, sidewalk, parking lot, patio, etc.)

 My project does not have Other Hard Surface areas

 1. Full dispersion

 Measured Infiltration Rate: ______ in/ hr

 2. Permeable pavement, rain gardens, or bioretention

 3. Sheet flow dispersion or concentrated flow dispersion

 4. On-site detention system or fle-in lier or on-site detention authorized by the City Engineer (applicable if options #1-) are infeasible and drainage from the site will be discharged to a storm or surface water \$1.0 m that includes a watercourse or there is a capacity constraint in the system)

 5. No Other Hard Surface BMP (applicable if options #1-3 are infeasible and on-site detention is not required)

If #4 or #5 is selected, briefly describe why no Other Hard Surface BMP is feasible (include detailed information in Section C of this submittal package):

Flow Control Exempt List

Proceed with this list if your project discharges directly to Lake Washington or if findings from a downstream analysis confirm that the downstream system is free of capacity constraints for a minimum of ¼ mile and a maximum of 1 mile.

For flow control exempt discharges, the BMPs listed below for Roofs and Other Hard Surfaces do not need to be evaluated in priority order. You can select any BMP from the lists provided below and do not need to document infeasibility in Section C of this submittal package.

Check <u>one</u> option for <u>each category</u> below:

Lawn and Landscape Areas

My project does not have Lawn or Landscape reas

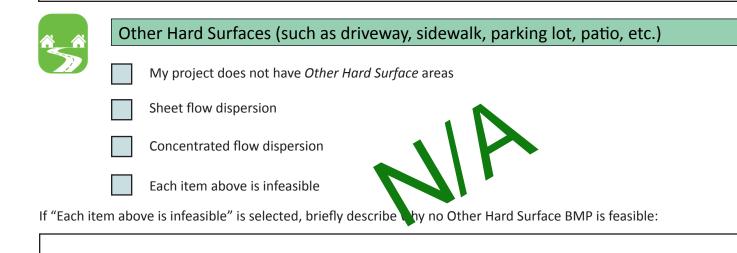

Post-construction soil quality and depth

SECTION A: SMALL PROJECT STORMWATER SITE PLAN/REPORT

Minimum Requirement #5 : On-site Stormwater Management (cont.)

	Roofs							
		My project does not have <i>Roof</i> areas						
		Downspout full infiltration						
		Downspout dispersion system						
		Perforated stub-out contractions						
		Each item above is infeasible						
If "Each ite	m abov	e is infeasible" is selected, briefly describe why no Roof BMP is feasible:						

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Instructions

This is a template for a simplified Construction Stormwater Pollution Prevention Plan ("Construction SWPPP"). If "No" is the answer to one or more of the statements on the first page of Section A of this submittal package, then a full Construction SWPPP is required and the project does not quality for the use of the Small Project Construction SWPPP Narrative template. If the project is less than the thresholds on the first page of Section A of this submittal package, then Minimum Requirement #2 still applies, but this section (Section B) or a full construction SWPPP is not required. You should include your Construction SWPPP in your contract with your builder. A copy of the Construction SWPPP must be located at the construction site or within reasonable access to the site for construction and inspection personnel at all times.

General Information on the Existing Site and Project

Describe the following in the Project Narrative box below (attach additional pages if necessary):

- Nature and purpose of the construction project
- Existing topography, vegetation, and drainage, and building structures
- Adjacent areas, including streams, lakes, wetlands, residential areas, and roads that might be affected by the construction project
- How upstream drainage areas may affect the site
- Downstream drainage leading from the site to the receiving body of water
- Areas on or adjacent to the site that are classified as critical areas
- Critical areas that receive runoff from the site up to one-quarter mile away
- Special requirements and provisions for working near or within critical areas
- Areas on the site that have potential erosion problems

Project Narrative:

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Construction SWPPP Drawings

Refer to the general Drawing Requirements in Stormwater Management Manual for Western Washington (SWMMWW) Volume I, Chapter 3.

Vicinity Map

Provide a map with enough detail to identify the location of the construction site, adjacent roads, and receiving waters.

Site Map

Include the following (where applicable):

	Legal description of the property boundaries or an illustration of property lines (including distances) on the drawings. see C2.0 Drainage Plan	Final and interim grade contours as appropriate, drainage basins, and the direction of stormwater flow during and upon completion of construction.
	North arrow.	Areas of soil disturbance, including all areas affected by clearing, grading, and excavation.
	Existing structures and roads. Boundaries and identification of different soil types.	Locations where stormwater will discharge to surface waters during and upon completion of construction.
	Areas of potential erosion problems.	Existing unique or valuable vegetation and vegetation to be preserved.
	Any on-site and adjacent surface waters, critical areas, buffers, flood plain boundaries, and Shoreline Management boundaries.	Cut-and-fill slopes indicating top and bottom of slope catch lines.
	Existing contours and drainage basins and the direction of flow for the different drainage areas.	Total cut-and-fill quantities and the method of disposal for excess material.
	Where feasible, contours extend a minimum of 25 feet beyond property lines and extend sufficiently to depict existing conditions.	Stockpile; waste storage; and vehicle storage, maintenance, and washdown areas.
Те	mporary and Permanent BMPs	
Inclu		
	de the following on site map (where applicable):	
	de the following on site map (where applicable): Locations for temporary and permanent swales, interceptor trenches, or ditches.	Details for bypassing off-site runoff around disturbed areas.
	Locations for temporary and permanent swales,	Details for bypassing off-site runoff around disturbed areas. Locations of temporary and permanent stormwater treatment and/or flow control best management practices (BMPs).
	Locations for temporary and permanent swales, interceptor trenches, or ditches. Drainage pipes, ditches, or cut-off trenches associated with erosion and sediment control and stormwater	Locations of temporary and permanent stormwater treatment and/or flow control best management practices (BMPs). Details for all structural and nonstructural erosion and sediment control (ESC) BMPs (including, but not limited to, silt fences, construction entrances, sedimentation facilities,

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 1: Preserve Vegetation / Mark Clearing Limits

The goal of this element is to preserve native vegetation and to clearly show the limits of disturbance.

This element **does not** apply to my project because:

Other Reason / Additional Comments:

If it **does** apply, describe the steps you will take and select the best management practices (BMPs) you will use:

The perimeter of the area to be cleared shall be marked prior to clearing operation with visible flagging, orange plastic barrier fencing and/or orange silt fencing as shown on the SWPPP site map. The total disturbed area shall be less than 7,000 square feet. Vehicles will only be allowed in the areas to be graded, so no compaction of the undeveloped areas will occur.

Additional Comments:

Check the BMPs you will use:

C101 Preserving Natural Vegetation

C102 Buffer Zones

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 2: Construction Access

The goal of this element is to provide a stabilized construction entrance/exit to prevent or reduce or sediment track out.

This element **<u>does not</u>** *apply to my project because:*

The driveway to the construction area already exists and will be used for construction access. All equipment and vehicles will be restricted to staying on that existing impervious surface.

Other Reason / Additional Comments:

If it <u>does</u> apply, describe the steps you will take and select the BMPs you will use:

A stabilized construction entrance will be installed prior to any vehicles entering the site, at the location shown on the SWPPP site map.

Additional Comments:

(

C105 Stabilized Construction Entrance / Exit

C106 Wheel Wash

C107 Construction Road / Parking Area Stabilization

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 3: Control Flow Rates

The goal of this element is to construct retention or detention facilities when necessary to protect properties and waterways downstream of development sites from erosion and turbid discharges.

This element **<u>does not</u>** *apply to my project because:*

Other Reason / Additional Comments:

If it <u>does</u> apply, describe the steps you will take and select the BMPs you will use:

Flow rates will be controlled by using SWPPP Element 4 sediment controls and BMP T5.13 Post-Construction Soil Quality and Depth if necessary.

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 4: Sediment Control

The goal of this element is to construct sediment control BMPs that minimize sediment discharges from the site.

This element **<u>does not</u>** apply to my project because:

The site has already been stabilized and re-vegetated.

Other Reason / Additional Comments:

If it <u>does</u> apply, describe the steps you will take and select the BMPs you will use:

Sediment control BMPs shall be placed at the locations shown on the SWPPP site map

Check the BMPs you will use:		
C231 Brush Barrier	C233 Silt Fence	C235 Wattles
C232 Gravel Filter Berm	C234 Vegetated Strip	

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 5: Stabilize Soils

The goal of this element is to stabilize exposed and unworked soils by implementing erosion control BMPs.

This element **<u>does not</u>** apply to my project because:

Other Reason / Additional Comments:

If it <u>does</u> apply, describe the steps you will take and select the BMPs you will use:

Exposed soils shall be worked during the week until they have been stabilized. Soil stockpiles will be located within the disturbed area shown on the SWPPP site map. Soil excavated for the foundation will be backfilled against the foundation and graded to drain away from the building. No soils shall remain exposed and unworked for more than 7 days from May 1 to September 30 or more than 2 days from October 1 to April 30. Once the disturbed landscape areas are graded, the grass areas will be amended using BMP T5.13 Post-Construction Soil Quality and Depth. All stockpiles will be covered with plastic or burlap if left unworked.

Check the BMPs you will us	se:					
C120 Temporary & Permanent Seeding	C12	2 Nets & Blankets	C124 Sodding	C131 Gradient] C2	35 Wattles
C121 Mulching	C12	23 Plastic Covering	C125 Topsoil / Composting	C140 Dust Control		

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 6: Protect Slopes

The goal of this element is to design and construct cut-and-fill slopes in a manner to minimize erosion.

This element **<u>does not</u>** *apply to my project because:*

No cut slopes over 4 feet high or slopes steeper than 2 feet horizontal to 1 foot vertical, and no fill slopes over 4 feet high will exceed 3 feet horizontal to 1 foot vertical. Therefore, there is no requirement for additional engineered slope protection.

Other Reason / Additional Comments:

If it <u>does</u> apply, describe the steps you will take and select the BMPs you will use:

Additional Comments:

r			
Check	k the BMPs you will use:		
	C120 Temporary & Permanent Seeding	C205 Subsurface Drains	C207 Check Dams
	C204 Pipe Slope Drains	C206 Level Spreader	C208 Triangular Silt Dike

(Geotextile-Encased Check Dam)

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 7: Protect Permanent Drain Inlets

The goal of this element is to protect storm drain inlets during construction to prevent stormwater runoff from entering the conveyance system without being filtered or treated.

This element **does not** apply to my project because:

The site has open ditches in the right-of-way or private road right-of-way.

There are no catch basins on or near the site.

Other Reason / Additional Comments:

If it **does** apply, describe the steps you will take and select the BMPs you will use:

Catch basins on the site or immediately off site in the right-of-way are shown on the SWPPP site map. Storm drain inlet protection shall be installed.

Additional Comments:

Check the BMPs you will use:

C220 Storm Drain Inlet Protection

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 8: Stabilize Channels and Outlets

The goal of this element is to design, construct, and stabilize on-site conveyance channels to prevent erosion from entering existing stormwater outfalls and conveyance systems.

This element **<u>does not</u>** *apply to my project because:*

Construction will occur during the dry weather. No storm drainage channels or ditches shall be constructed either temporary or permanent. A small swale shall be graded to convey yard drainage around the structure using a shallow slope; it shall be seeded after grading and stabilized.

Other Reason / Additional Comments:

If it **does** apply, describe the steps you will take and select the BMPs you will use:

A wattle shall be placed at the end of the swale to prevent erosion at the outlet of the swale.

Additional Comments:

Check the BMPs you will use:

C202 Channel Lining

C207 Check Dams

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 9: Control Pollutants

The goal of this element is to design, install, implement and maintain BMPs to minimize the discharge of pollutants from material storage areas, fuel handling, equipment cleaning, management of waste materials, etc.

This element **<u>does not</u>** *apply to my project because:*

If it <u>does</u> apply, describe the steps you will take and select the BMPs you will use:

Any and all pollutants, chemicals, liquid products and other materials that have the potential to pose a threat to human health or the environment will be covered, contained, and protected from vandalism. All such products shall be kept under cover in a secure location on-site. Concrete handling shall follow BMP C151.

Additional Comments:

C151 Concrete Handling C152 Sawcutting and Surfacing Pollution Prevention

C153 Material Delivery, Storage, and Containment

C154 Concrete Washout Area

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 10: Control De-watering

The goal of this element is to handle turbid or contaminated dewatering water separately from stormwater.

This element **<u>does not</u>** apply to my project because:

No dewatering of the site is anticipated.

Other Reason / Additional Comments:

If it <u>does</u> apply, describe the steps you will take and select the BMPs you will use:

Additional Comments:

Check the BMPs you will use:

C203 Water Bars

C236 Vegetated Filtration

C206 Level Spreader

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 11: Maintain Best Management Practices

The goal of this element is to maintain and repair all temporary and permanent erosion and sediment control BMPs to assure continued performance.

Describe the steps you will take:

Best Management Practices or BMPs shall be inspected and maintained during construction and removed within 30 days after the City Inspector or Engineer determines that the site is stabilized, provided that they may be removed when they are no longer needed.

Element 12: Manage the Project

The goal of this element is to ensure that the construction SWPPP is properly coordinated and that all BMPs are deployed at the proper time to achieve full compliance with City regulations throughout the project.

If it <u>does</u> apply, describe the steps you will take and select the BMPs you will use:

The Construction SWPPP will be implemented at all times. The applicable erosion control BMPs will be implemented in the following sequence:

1. Mark clearing limits

- 2. Install stabilized construction entrance
- 3. Install protection for existing drainage systems and permanent drain inlets
- 4. Establish staging areas for storage and handling polluted material and BMPs
- 5. Install sediment control BMPs
- 6. Grade and install stabilization measures for disturbed areas
- 7. Maintain BMPs until site stabilization, at which time they may be removed

SECTION B: SMALL PROJECT CONSTRUCTION SWPPP NARRATIVE

Element 13: Protect Low Impact Development BMPs

The goal of this element is to protect on-site stormwater management BMPs (also known as "Low Impact Development BMPs") from siltation and compaction during construction. On-site stormwater management BMPs used for runoff from roofs and other hard surfaces include: full dispersion, roof downspout full infiltration or dispersion systems, perforated stubout connections, rain gardens, bioretention systems, permeable pavement, sheetflow dispersion, and concentrated flow dispersion. Methods for protecting on-site stormwater management BMPs include sequencing the construction to install these BMPs at the latter part of the construction grading operations, excluding equipment from the BMPs and the associated areas, and using the erosion and sedimentation control BMPs listed below.

Describe the construction sequencing you will use:

Additional Comments:

Select the BMPs you will use:

C102 Buffer Zone

C103 High Visibility Fence

C231 Brush Barrier

C233 Silt Fence

C234 Vegetated Strip

SECTION C: INFEASIBILITY CRITERIA

Minimum Requirement #5 (On-Site Stormwater Management)

The following tables summarize infeasibility criteria that can be used to justify not using various on-site stormwater management best management practices (BMPs) for consideration for Minimum Requirement #5. This information is also included under the detailed descriptions of each BMP in the 2014 Stormwater Management Manual for Western Washington (Stormwater Manual), but is provided here in this worksheet for additional clarity and efficiency. Where any inconsistencies or lack of clarity exists, the requirements in the main text of the Stormwater Manual shall be applied. If a project is limited by one or more of the infeasibility criteria specified below, but an applicant is interested in implementing a specific BMP, a functionally equivalent design may be submitted to the City for review and approval. Evaluate the feasibility of the BMPs in priority order based on List #1 or #2 (Small Project Stormwater Requirements Tip Sheet and Stormwater Manual). Select the first BMP that is considered feasible for each surface type. Document the infeasibility (narrative description and rationale) for each BMP that was not selected. Only one infeasibility criterion needs to be selected for a BMP before evaluating the next BMP on the list. Attach additional pages for supporting information if necessary.

Note: If your project discharges directly to Lake Washington (flow control exempt) or a downstream analysis confirms that the downstream system is free of capacity constraints for a minimum of ¼ mile and a maximum of 1 mile, then you do not need to complete this worksheet, but should still refer to the infeasibility criteria when selecting BMPs.

	Lawn and Landscaped Areas	
b. 1P and Applic toble Lists	Infeasibility Criteria	Infeasibility Description and Rationale for Each BMP Not Selected
Post-construction Soil Quality and Depth	Siting and design criteria provided in BMP T5.13 (Stormwater Manual Volume V, Section 5.3) cannot be achieved.	
List #1 and #2	wn and landscape area is on till slopes greater than 33 percent.	
	Roofs	
BMP and Applicable Lists	Infeasibility Criteria	Infeasibility Description and Rationale for Each BMP Not Selected
Full Dispersion List #1 and #2	 Site setbacks and design citeria provided in BM r T5.30 (Stormwater Manual Volume V, Section 5.3) cannot be achieved. A 65 to 10 ratio of forested or nacle sugetation area to impervious area cannot be achieved. A minimum forested or native vegetation newpath length of 100 feet (25 feet for sheet flow from a non-native pervious surface) cannot be achieved. 	
Downspout Full Infiltration List #1 and #2	 Evaluation of infiltration is not required per the Infiltration Infeasibility Mup due to steep slopes, erosion hazards, or nodslide hazards. Site sucbacks and design criteria provided in BMP T5.10A (Surmwater Manual Volume III, Section 3.1.1) cannot be achieved. The lot(s) or site does not have out-wash or loam soils. 	
	 There is not at least 3 feet or more of permeable soil from the proposed final grade to the seasonal high groundwater table or other impermeable layer. There is not at least 1 foot or more of permeable soil from the proposed bottom of the infiltration system to the seasonal high groundwater table or other impermeable layer. 	

	Roofs (cont.)	
3MP and A _F nlicable Lits	Infeasibility Criteria	Infeasibility Description and Rationale for each BMP Not Self sted
	Note: Criteria with setback distances are as measured from the bottom edge of the bioretention soil mix.	
	Citation of any of the following infeasibility criteria must be based on an valuation of site-specific conditions and a written recommendation from an ap, copriate licensed professional (e.g., engineer, geologist, hydrogeologist):	
	Where professional geotechnical evaluation recommends infiltration not be used due to reasonable concerns about erosion, slope failure or down-gradient flooding.	
	Within an crea whose ground water drains into an erosion hazard, or landslide haz rd area.	
Bioretention or Rain Gardens	Where the only a ba available for siting would threater, the safety or reliability of pre-cristing underground utilities, pre-existing underground storage conks, pre-existing structure, or pre-existing road or parking lot surfaces.	
List #1 (both) and List #2 (bioretention only)	Where the only area available for siting dries not allow for a safe overflow pathway to stormwate, drainage system or private storm sewer system.	
	Where there is a lack of usable space for bioretention areas at re- development sites, or where there is insulficient space within the existing public right-of-way on public road publics.	
	Where infiltrating water would threaten existing below grade basements.	
	Where infiltrating water would threaten shoreline structures such as bulkhead.	
	The following criteria can be cited as reasons for infeasibility without further justrication (though some require professional services to make the observation):	
	Evaluation of infiltration is not required per the Infiltration Infeasibility Map due to steep slopes, erosion hazards, or landslide hazards	
	Within setback provided for BMP T7.30 (Stormwater Manual Volume V, Section 7.4)	
	Where they are not compatible with surrounding drainage system as determined by the city (e.g., project drains to an existing stormwater collection system whose elevation or location precludes connection to a properly functioning bioretention area).	

	Roofs (cont.)	
3MP and A _F plicable Lots	Infeasibility Criteria	Infeasibility Description and Rationale for Lach BMP Not Self Led
	The following criteria can be cited as reasons for infeasibility without further justification (though some require professional services to make the observation):	
	Where land for bioretention is within an erosion hazard, or landslide hazard area (as defined by MICC 19.07.060).	
	(here the site cannot be reasonably designed to locate bic etention areas on slopes less than 8 percent.	
	Within 10 feet from the top of slopes that are greater than 20 percent at 1 over 10 feet of vertical relief.	
Bioretention or	For properties with known soil or groundwater contaming don (typically federal, uperfund sites or state cleanup sites under the Model Toxics Control Act [MTCA]):	
Rain Gardens (cont.)	 Within 100 fect of an area known to have deep soil contamination. 	
	 Where groundwater modeling indicates infiltration will likely increase or change the direction of the migration of pollutants in the groun invater. 	
	 Wherever surface soil have been found to be contaminated unler, those soils are removed within 10 horizontal feet from the infiltration area. 	
	• Any area where these facilities are probaited by an approved cleanup plan under the state Min SA or Federal Superfinid Law, or an environmental covenary under Charlier 64.70 RCW.	
	Within 10 feet of a closed or active landfill.	
	Within 10 feet of an underground storage tank and connecting un erground pipes when the capacity of the tank and pipe system 1,100 gallons or less. As used in these criteria, an underground storage tank means any tank used to store petroleum products, chemicals, or liquid hazardous wastes of which 10 percent or more of the storage volume (including volume in the connecting piping	
	 system) is beneath the ground surface. Within 100 feet of an underground storage tank and connecting underground pipes when the capacity of the tank and pipe system is greater than 1,100 gallons. 	

	Roofs (cont.)	
3MP and A _F plicable Lots	Infeasibility Criteria	Infeasibility Description and Rationale for tach BMP Not Self sted
Lits Bioretention or Rain Gardens (cont.)	 The following criteria can be cited as reasons for infeasibility without further justification (though some require professional services to make the observation): Where field testing indicates potential bioretention/rain garden sites have a measured (a.k.a., initial) native soil saturated hydraulic conductivity less than 0.30 inches per hour. A small-scale or large-1 ale PIT in accordance with Stormwater Manual Volume III, Section 3.5 % (or an alternative small scale test specified by the City) shall be us d to demonstrate infeasibility of bioretention areas. If the measure d native soil infiltration rate is less than 0.30 in/hour, bioretention a List #1 or List #2. In these slow draining soil a bioretention area with an underdrain may be used to treac pollution-generating surfaces to help meet Minimum Requirement #6, Runoff Treatment. If the univerdrain is elevated within a base course of gravel, it will also provile some modest flow reduction benefit that will help achieve Minimum a Requirement #7. Where the minimum vertical aparation of a feet to the seasonal high groundwater elevation or o her imfermeable layer would not be achieved below bioretention that would serve a drainage area that exceeds the following threshola. Yand cannot reasonably be broken down into amounts smaller that indicated): 5,000 square feet of pullution-generating impervious surface (PGIS) 10,000 square fiel of impervious area 	BMP Not Selected
	 o 10,000 square ret of impervious area o 0.75 acres if lawn and landscape. Where the minimum vertical separation of 1 foot to the seal and high groundwater or other impermeable layer would not be achieved below bioretention that would serve a drainage area leathar the above thresholds. Within 100 feet of a drinking water well, or a spring used for drinking water supply. Within 10 feet of small on-site sewage disposal drainfield, including reserve areas, and grey water reuse systems. For setbacks from a "large on-site sewage disposal system," see Chapter 246-272B WAC.

Downspout	Site setbacks and design criteria provided in BMP T5.10B (Stormwater Manual Volume III, Section 3.1.2) cannot be achieved.	
Dispersion Systems List #1 and #2	For splash blocks, a vegetated flowpath at least 50 feet in length from the downspout to the downstream property line, structure, stream, wetland, slope over 15 percent, or other impervious surface is not it asible.	
	For tranches, a vegetated flowpath of at least 25 feet in between the outlet of the trench and any property line, structure, stream, we dand, or impervious surface is not feasible. A vegetated flowpath of at least 50 feet between the outlet of the trench and any slope stepper than 15 percent is not feasible.	
	Evaluation of infiltration on trequired per the infiltration Infeasibility Map due to steep slopes, ellipsion hazards, or landslide hazards	
Perforated Stub-Out Connections List #1 and #2	For sites with septic systems, the color ocation available for the perforated portion of the pipe is acated up-gradient of the drainfield primary and reserve across. This requirement can be waived if site topography will learly prohibit flows from intersecting the drainfield or where site conditions (soil parmeability, distance between systems, etc.) in acate that this is unit cessary.	
	Site setbacks and dougn criteria provided in BMP T5 10C (Stormwater Marual Volume III, Section 3.1.3) cannot be achieved.	
	There is not a least 1 foot of permeable soil from the proposed bottom (final grade) of the perforated stub-out connection trench to the highest estimated groundwater table or other impermeable layer	
	The only location available for the perforated stub-out connection is under impervious or heavily compacted soils.	
On-site	Project discharges directly to Lake Washington.	
Detentic List #1 and #2	Findings from a 1/4 mile downstream analysis confirm that the downstream system is free of capacity constraints.	
	Site setbacks and design criteria provided in the Stormwater Manual (Volume III, Section 3.2.2) cannot be achieved.	

	Other Hard Surfaces	
3MP and A _F ilicable Lis	Infeasibility Criteria	Infeasibility Description and Rationale for each BMP Not Self ced
	Site setbacks and design criteria provided in BMP T5.30 (Stormwater Manual Volume V, Section 5.3) cannot be achieved.	
Full Dispersion	A 65 to 10 ratio of forested or native vegetation area to impervious area cannot be achieved.	
List #1 and #2	A minimum forested or native vegetation flowpath length of 100 feet (2.5 feet for sheet flow from a non-native pervious surface) cannot be ach. ved.	
	Citation of any o, the following infeasibility criteria must be based or an evaluation of site-s, ecific conditions and a written recommendation from an appropriate licensed, cofessional (e.g., engineer, geologist, hydrogeologist):	
	Where professional geotechnical evaluation recommends infiltration not be used due to re-sonable concerns about erosion, slope failure, or downgradient floodies.	
	Within an area whose ground water drains into an erosion hazard, or landslide hazard area.	
Permeable	Where infiltrating and ponded wate below the new permeable pavement area would compromise ad, cent impervious pavements.	
Pavement	Where infiltrating water below a new perm, able pavement area would threaten existing below grade basements.	
	Where infiltrating water would threaten shoreline tructures such as bulkheads.	
	Down slope of steep, erosion prone areas that are likely to deliver sediment.	
	Where all soils are used that can become unstable when saturate t.	
	Ex essively steep slopes where water within the aggregate base ayer or at the subgrade surface cannot be controlled by detention structures and may cause erosion and structural failure, or where surface runoff velocities may preclude adequate infiltration at the pavement surface.	
	Where permeable pavements cannot provide sufficient strength to support heavy loads at industrial facilities such as ports.	
	Where installation of permeable pavement would threaten the safety or reliability of pre-existing underground utilities, pre-existing underground storage tanks, or pre-existing road subgrades.	

	Other Hard Surfaces (cont.)	
BMP and Applicable Lots	Infeasibility Criteria	Infeasibility Description and Rationale for each BMP Not Self sted
	The following criteria can be cited as reasons for infeasibility without further justification (though some require professional services to make the observation):	
	Evaluation of infiltration is not required per the Infiltration Infeasibility Map due to steep slopes, erosion hazards, or landslide hazards	
	Within an area designated as an erosion hazard, or landslide hazard.	
	Within 50 feet from the top of slopes that are greater than 20 percent	
	For properties with known soil or groundwater contamination (typically federal Superfund sites or state cleanup sites upper MTCA):	
	 Within 2 10 feet of an area known to have d'ep soil contamination. 	
Permeable Pavement (cont.)	 Where ground vater modeling indicates infiltration will likely increase or change the direction of the migration of pollutants in the groundwater. 	
(contr)	 Wherever surface soil, have been found to be contaminated unless there pils are removed within 10 horizontal feet from the instruction area. 	
	 Any area where these vacilities are prohibited by an approved cleanup r an under the state MTCA or Federal Superfund Law, or an environmental covenant under Chapter 64.70 F LW. 	
	Within 100 feet of a cosed or active landfill.	
	Within 100 feet of a drinking water well, or a spring use. for drinking water supply of the pavement is a pollution-generating surface.	
	Within 1 feet of a small on-site sewage disposal drainfield, inc. ding reserve areas, and grey water reuse systems. For setbacks from a "large on-site sewage disposal system," see Chapter 246-272B WAC.	
	Within 10 feet of any underground storage tank and connecting underground pipes, regardless of tank size. As used in these criteria, an underground storage tank means any tank used to store petroleum products, chemicals, or liquid hazardous wastes of which 10 percent or more of the storage volume (including volume in the connecting piping system) is beneath the ground surface.	
	At multi-level parking garages, and over culverts and bridges.	
	Where the site design cannot avoid putting pavement in areas likely to have long-term excessive sediment deposition after construction (e.g., construction and landscaping material yards).	

	Other Hard Surfaces (cont.)	
BMP and A _F plicable L. ts	Infeasibility Criteria	Infeasibility Description and Rationale for tach BMP Not Self ted
	The following criteria can be cited as reasons for infeasibility without further justification (though some require professional services to make the observation):	
Permeable Pavement (cont.)	 Where the site cannot reasonably be designed to have: Porous asphalt surface < 5% slope Pervious concrete surface < 10% slope Permeable interlocking concrete pavement surface < 12% slope Grid systems < 6-12% slope (check with manufacturer and local supplier to confirm maximum slope) Where the ubgrade soils below a pollution-generating permeable pavement (e.g. road or parking lot) do not meet the soil sutability criteria for proving treatment. See soil suitability criteria for proving treatment. See soil suitability criteria for proving treatment. See soil suitability criteria for a for treatment in the S. rmwater Manual Volume III, Section 3.3.7. Note: In these instances, the city may approve instruction of a 6 inch sand filter layer musting city specifications for treatment as a condition of construction. Where underlying soils are unsuitable for supporting traffic loads when saturated. Soils meeting a califor in a Bearing Ratio of 5 percent are considered suitable for resident in access roads. Where replacing existing impervious such ces unless the existing surface is a non-pollution generating surface over an outwash soil with a saturated hydraulic conductivity of 4. I ches per hour or greater. Where appropriate fold testing indicates soils have measured (a.k.a., initial) sub-a de soil saturated hydraulic conductivity less than 0.3 inches er hour. Only small-scale PIT or large-sule PIT methods in an ordance with Stormwater Manual Volume 'I. Section 3.3.6 (or an uternative small scale test specified by the City) hall be used to evaluate infeasibility of permeable pavement areas. (Note:, these instances, unless other infeasibility restrictions a, 1/k, road and parking lots may be built with an underdrain, preferably 	
	elr ated within the base course, if flow control benefits are desired.) Roads that receive more than very low traffic volumes, and areas having more than very low truck traffic. Roads with a projected average daily traffic volume of 400 vehicles or less are very low volume roads (AASHTO 2001) (U.S. Department of Transportation, 2013). Areas with very low truck traffic volumes are roads and other areas not subject to through truck traffic but may receive up to weekly use by utility trucks (e.g., garbage, recycling), daily school bus use, and multiple daily use by pick-up trucks, mail/parcel delivery trucks, and maintenance vehicles. (Note: This infeasibility criterion does not extend to sidewalks and other non-traffic bearing surfaces associated with the collector or arterial).	

	Other Hard Surfaces (cont.)	
3MP and A _F plicable L. ts	Infeasibility Criteria	Infeasibility Description and Rationale for each BMP Not Self ced
	The following criteria can be cited as reasons for infeasibility without further justification (though some require professional services to make the observation):	
Permeable Pavement	At sites defined as "high-use sites" (refer to the Glossary in the Stormwater Manual Volume I).	
(cont.)	In areas with "industrial activity" as identified in 40 CFR 122.26(b)(14).	
	Where the risk of concentrated pollutant spills is more likely such as gas solutions, truck stops, and industrial chemical storage sites.	
	Where rootine, heavy applications of sand occur in frequent show zones to main traction during weeks of snow and ice accumulation.	
	Where the sease al high groundwater or an underlying impermeable/ low permeable lay, would create saturated conditions within 1 foot of the bottom of the towest gravel base course.	
	Note: Criteria with setback distances are as measured from the bottom edge of the bioretention soil mix.	
	Citation of any of the following infeasible ty conceria must be based on an evaluation of site-specific conditions and convritten recommendation from an appropriate licensed professional (e.g., congreger, geologist, hydrogeologist):	
Bioretention or Rain Gardens	Where professional geotechnical evaluation recommends infiltration not be used due to reasonable concerns about erosion, slope failure, or down-grouient flooding.	
List #1 (both) and List #2 (bioretention	Within an area whore ground water drains into an elosion hazard, or landslide hazar area.	
only)	Where the or y area available for siting would threaten the safety or reliability of pre-existing underground utilities, pre-existing underground storage tanks, pre-existing structures, or pre-existing road or parking lot surfaces.	
	Vinere the only area available for siting does not allow for a safe overflow pathway to stormwater drainage system or private storm sewer system.	
	Where there is a lack of usable space for bioretention areas at re- development sites, or where there is insufficient space within the existing public right-of-way on public road projects.	
	Where infiltrating water would threaten existing below grade basements.	
	Where infiltrating water would threaten shoreline structures such as bulkheads.	

	Other Hard Surfaces (cont.)	
3MP and A _F plicable L. ts	Infeasibility Criteria	Infeasibility Description and Rationale for each BMP Not Self ced
	The following criteria can be cited as reasons for infeasibility without further justification (though some require professional services to make the observation): Where evaluation of infiltration is not required per the Infiltration	
	 Infeasibility Map due to steep slopes, erosion hazards, or landslide hazards. Within setback provided for BMP T7.30 (Stormwater Manual Volume Section 7.4) 	
	 V. Section 7.4) When they are not compatible with surrounding drainage system as determ, ed by the city (e.g., project drains to an existing storm; ater collection ystem whose elevation or location precludes connection to a properly functioning bioretention area). 	
Bioretention or	Where land for b pretention is within an erosion hazarr or landslide hazard area (as denied by MICC 19.07.060).	
Rain Gardens (cont.)	Where the site cannot by reasonably designed to locate bioretention areas on slopes less than copercent.	
	Within 50 feet from the top of lopes that are greater than 20 percent and over 10 feet of vertical relien.	
	For properties with known soil or coondwater contamination (typically federal Superfund sites or state cleanup sites under the Model Toxics Control Act [MTC]):	
	 Within 100 ferg of an area known to have deep soil contamination. 	
	 Where coundwater modeling indicates is filtration will likely increase or change the direction of the migration of po' atants in the groundwater. 	
	 Wherever surface soils have been found to be contaminated unless those soils are removed within 10 horizontal feet from the infiltration area. 	
	• Any area where these facilities are prohibited by an approved cleanup plan under the state MTCA or Federal Superfund Law, or an environmental covenant under Chapter 64.70 RCW.	
	Within 100 feet of a closed or active landfill.	
	Within 10 feet of an underground storage tank and connecting underground pipes when the capacity of the tank and pipe system is 1,100 gallons or less. As used in these criteria, an underground storage tank means any tank used to store petroleum products, chemicals, or liquid hazardous wastes of which 10 percent or more of the storage volume (including volume in the connecting piping system) is beneath	
	the ground surface.	

	Other Hard Surfaces (cont.)	
3MP and A _F plicable Lots	Infeasibility Criteria	Infeasibility Description and Rationale for tach BMP Not Selected
	The following criteria can be cited as reasons for infeasibility without further justification (though some require professional services to make the observation):	
Bioretention or Rain Gardens (cont.)	 Within 100 feet of an underground storage tank and connecting underground pipes when the capacity of the tank and pipe system is greater than 1,100 gallons. V here field testing indicates potential bioretention/rain garden site, have a measured (a.k.a., initial) native soil saturated hydraulic condultivity less than 0.30 inches per hour. A small-scale or large scale PI'n accordance with Stormwater Manual Volume III, Srition 3.3.6 (or an alternative small scale test specified by the City) nall be used to de nonstrate infeasibility of bioretention areas in the measured native soil infiltration rate is less than 0.30 in hour, bioretention/rain griden BMPs are not required to be evaluated as an option in List #, or List #2. In these slow drain gisls, a bioretention area with n underdrain may be use a to treat pollution-generating surfaces to he, meet Minimum Requirement #6, Runoff Treatment. If the underdrain is elevated with in a base course of gravel, it will also provide some modest ff. W reduction benefit that will help achieve Minimum Requirement #7. Where the minimum vertical separation of 3 feet to the seasonal high groundwater elevation or since importaneable layer would not be achieved below bioretent in that would serve a drainage area that exceeds the following inresholds (and ca not reasonably be broken down into amounds smaller than indicau d): o 5,000 square feet of pollution-generating importious surface (PG a) o 10,000 square feet of impervious area o 0 5 acres of lawn and landscape. W'l are the minimum vertical separation of 1 foot to the seasonal high groundwater or other impermeable layer would not be achieved below bioretention area 	
	Within 100 feet of a drinking water well, or a spring used for drinking water supply.	
	Within 10 feet of small on-site sewage disposal drainfield, including reserve areas, and grey water reuse systems. For setbacks from a "large on-site sewage disposal system," see Chapter 246-272B WAC.	

	Other Hard Surfaces (cont.)	
3MP and A _F plicable L. ts	Infeasibility Criteria	Infeasibility Description and Rationale for each BMP Not Self ced
	Site setbacks and design criteria provided in BMP T5.12 (Stormwater Manual Volume V, Section 5.3) cannot be achieved.	
Sheet Flow Dispersion	Positive drainage for sheet flow runoff cannot be achieved.	
List #1 and #2	Area to be dispersed (e.g., driveway, patio) cannot be graded to have less than a 15 percent slope.	
	For lat to moderately sloped areas, at least a 10 foot-wide vegetation buffer for dispersion of the adjacent 20 feet of contributing surfar cannot be achieved. For variably sloped areas, at least a 25 foot vegetated to pwpath between berms cannot be achieved.	
Concentrated Flow Dispersion List #1 and #2	 Site setbacks and design criteria provided in BMP v5.11 (Stormwater Manual Volume V, Sectio. 5.3) cannot be achieved. A minimum 3 foot length of rock pad and v0 foot flowpath OR a dispersion trench and 25 foot flowpath or every 700 square feet of drainage area followed with applicable setbacks cannot be achieved. More than 700 square feet drainage area drains to any dispersion device. 	
On-site Detention List #1 and #2	 Project discharges directly to Lake Washington. Findings from a 1/4 mile downstream analysis confirm that the downstream system is free of capacity constraints. Site setbacks and design criteria provided in the Stormwater Manual (Volume III, Section 3.2.2) cannot be achieved. 	

SECTION D: POST-CONSTRUCTION SOIL MANAGEMENT

Attachments Required (Check off required items that are attached)
Site Plan showing, to scale: Areas of undisturbed native regetation (no amendment required) New planting tods (mendment required) New turnareas (needment required) Type of soil improvement proposed for each area
 Soil test results (required if proposing custom colendment rates) Product test results for proposed amendments

Total Amendment / Topsoil / Mulch for All Areas

Calculate the quantities needed for the entire site based on all of the areas identified on the Site Plan and the calculations on the following page(s):

Product	Total Quantity (CY)	Test Results
Product #1:	CY	% organic matter C:N ratio "Stable"?yesno
Product #2:	CY	% organic matter C:N ratio "Stable"? yes no
Product #3:	CY	% organic matter C:N ratio "Stable"? yes no

CY = cubic yards, C:N = Carbon:Nitrogen

SECTION D: POST-CONSTRUCTION SOIL MANAGEMENT

Amendment / Topsoil / Mulch by Area

For each identified area on your Site Plan, provide the following information: (Use additional sheets if necessary)

Area #	(should match identified Area # op Site Papa)	A	
	Turf UN disturbed native vegetation Planting Beds Other	ect
