# Pervious Paver Info

- General:** Installation must be in accordance with the manufacturer's requirements and specifications.
- Subgrade:** Compact the subgrade to the minimum necessary for structural stability. Use static dual wheel small mechanical rollers or plate vibration machines for compaction. Do not allow heavy compaction due to heavy equipment operation. The subgrade should not be subject to truck traffic.
- Geotextile:** Geotextile fabric shall be placed beneath the reservoir layer in areas where soil remains saturated part of the year, where there is soil freeze and thaw, or over clay and moist silty subgrade soils. The geotextile fabric should pass water at a greater rate than the subgrade soils.
- Underdrain:** Provide an underdrain pipe when subgrade soils are poorly draining, or soils remain saturated part of the year.
- Aggregate Materials (stone fill, leveling course, and base/sub-base reservoir layer):** Use "open graded" rock containing only a small percentage of aggregate in the small range. Do not use round rock.
  - Joint Fill** – ASTM No. 8 washed crushed aggregate. ASTM No. 89 or No. 9 washed crushed aggregate may also be used. Minimum 1" to 2" thickness.
  - Leveling Course** – Minimum 1" thickness washed sand or washed crushed aggregate
  - Reservoir Course** – ASTM No. 57 crushed aggregate. Minimum 6" to 12" thickness depending on permeability of the subgrade soils.
- Limitations:**
  - If surface drainage comes from minor or incidental pervious areas, those areas must be fully stabilized.
  - Slope adjacent impervious surfaces away from the pavers to the maximum extent practicable.
  - Sheet flow from up-gradient impervious area is not recommended, but permissible if the area of permeable interlocking concrete pavers is greater than or equal to the impervious pavement area.
  - The maximum installed slope of the permeable interlocking concrete pavers is generally 12 percent.
- Protection:** After work is complete, the contractor shall be responsible for protecting work from sediment deposition and damage due to subsequent construction activity on the site.
  - Keep heavy equipment off existing soils underneath the proposed paver area to preserve the native soil infiltration rate.
  - Do not allow muddy construction equipment on the base material or pavers.
  - Do not allow sediment-laden runoff onto the pavers.
  - The contractor shall be responsible for protecting work from sediment deposition and damage due to subsequent construction activity on the site.
- Improper Installation:** Pavers fouled with sediments or no longer passing an initial infiltration test (ASTM C1781) must be cleaned using procedures recommended by the paver manufacturer. If cleaning does not restore infiltration rates or other construction issues have been observed, reinstallation of the pavers may be required.
- Inspections:** The contractor shall call for inspection of the subgrade preparation prior to placement of the reservoir course and for a subsequent inspection of the reservoir course placement prior to installation of pavers.
- Maintenance:** Homeowners must adequately maintain their permeable block pavements. Over time, the space between the pavers will tend to clog.
  - Annual inspections - Conduct periodic visual inspections to determine if surfaces are clogged with vegetation or fine grained sediment. If water runs off the pavement and/or there is ponding during a rain event, then the surface may be clogged. Clogged surfaces should be corrected within one year.
  - Routine surface cleaning – Surfaces should be cleaned with a ShopVac, brush broom, or walk-behind vacuum annually. Surface cleaning is recommended twice per year; preferably, once in the autumn after leaf fall, and again in early spring.
  - Damaged pavers – Remove individual pavers by hand and replace or repair per manufacturer's recommendations.
  - Loss of joint fill – Refill per manufacturer's recommendations.
