Offe Engineers, PLLC Darrell Offe, P.E. 13932 SE 159th Place Renton, Washington 98058 425-260-3412 Darrell.Offe@comcast.net

TABLE OF CONTENT

Section 1: Project Narrative Section 2: Site Evaluation Section 3: Minimum Requirements Appendix A: Geotechnical Evaluation Appendix B: WWHM Modeling

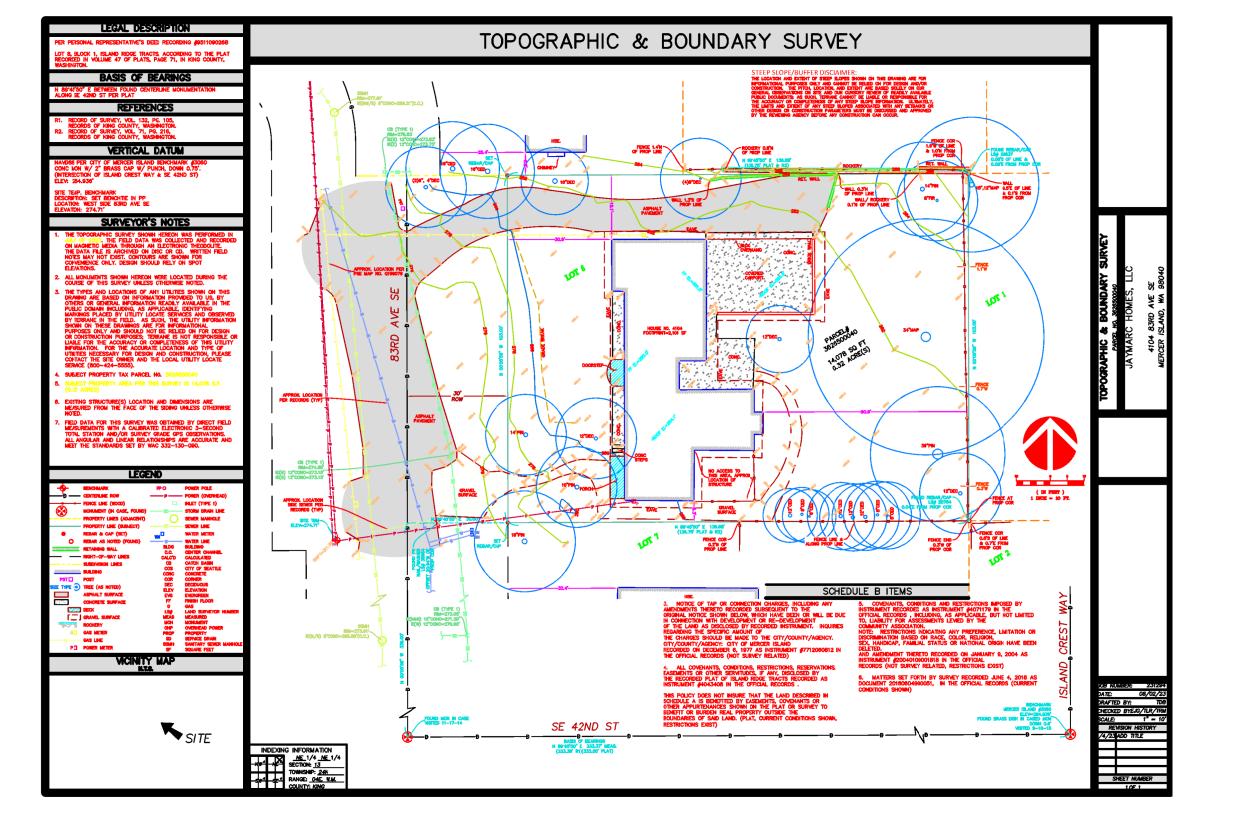

Section 1: Project Narrative:

The subject property is located on the west of Island Crest Way and North of SE 42nd Street. The subject property takes access from the 83rd Avenue SE on at the northwest corner of the property. There is an existing house, long asphalt driveway, and patio area on the property. These features will all be removed for the new residence. All public and franchise utilities are located on the west side within 83rd Avenue SE.

The site soils are characterized between Vashon Glacial Till and infeasible for infiltration type BMPs by Cobalt Geosciences, Geotechnical Evaluation attached within this Report. City staff has determined that on-site detention is required for this new development, sizing of on-site system is included within the Report.

The property was visited in September and November 2023 to verify runoff patterns and possible storm water discharge options. The downstream system was reviewed and walked, where possible.

The project will be evaluated for storm water treatment and control using the Amended December 2014 SWMMWW (DOE Manual).

Section 2: Site Evaluation

Total Lot Area = 14,078 square feet (0.32 acres)

EXISTING CONDITIONS

Impervious:

Roof area = 3,708 sq. feet Uncovered walkway = 542 sq. feet Uncovered patio = 138 sq. feet Uncovered driveway = 1,563 sq. feet ((PGHS)) Subtotal: 5,951 sq. feet

Pervious:

Lawn, trees, landscaping = 8,127 sq. feet

DEVELOPED CONDITIONS

Impervious (hard) surfaces: House roof area w/overhang = 4,988 sq. feet Uncovered driveway = 722 sq. feet ((PGHS)) Uncovered walkway/pads = <u>104 sq. feet</u> *Total Impervious (Hard) Surfaces = 5,814 sq. feet*

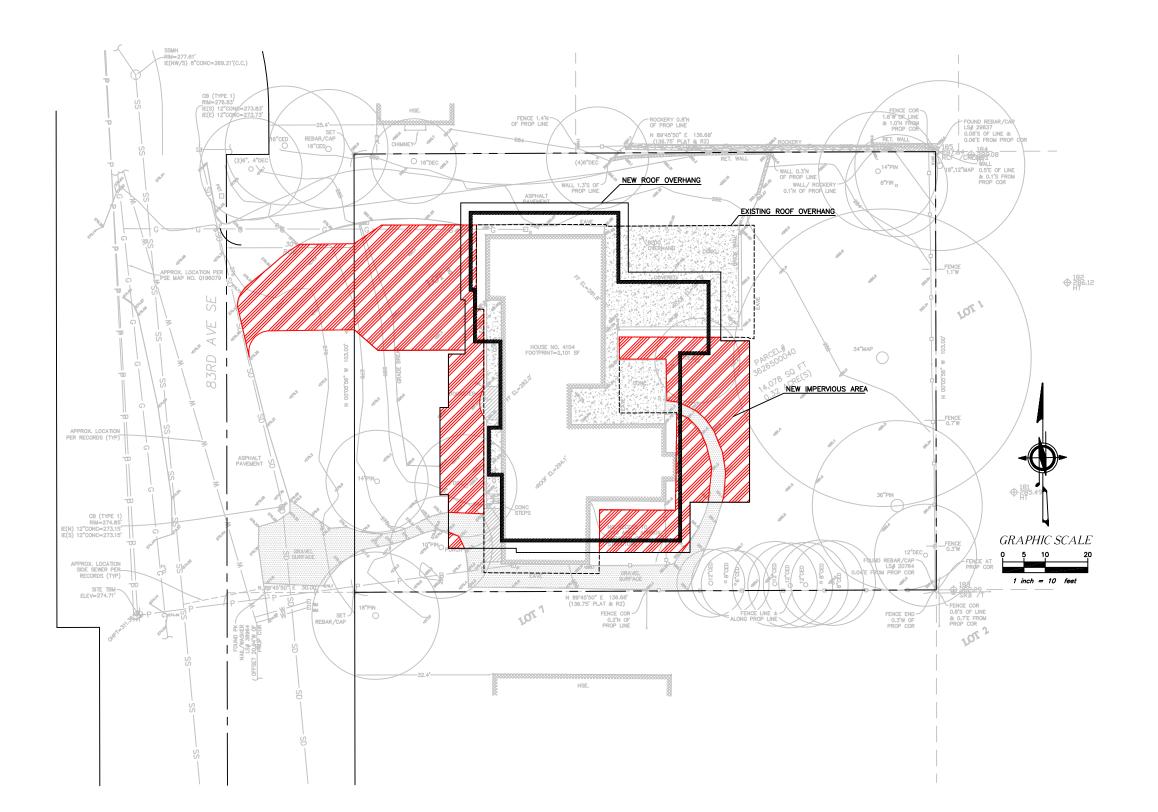

Pervious Surfaces: Ex. Lawn, trees, landscaping = *8,127 sq. feet* Added landscaping = <u>137 sq. feet</u> *Total Pervious Surfaces = 8,264 square feet*

((PGHS)) -Pollution Generating Hard Surface

Summary of Project Information

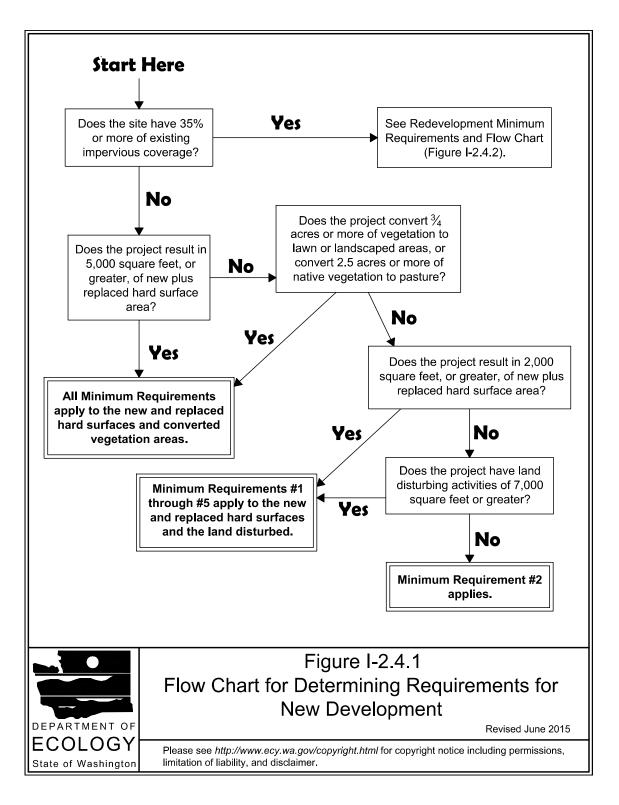

| Project Site Area | 14,078 square feet |
|-------------------------------------|--------------------|
| Existing Impervious Area | 5,921 sq. feet |
| Existing Impervious Coverage | 42.0% |
| New Impervious Area | 3,248 sq. feet |
| Replaced Impervious Area | 2,566 sq. feet |
| New plus Replaced Impervious | 5,814 square feet |
| Proposed Impervious Area | 5,814 square feet |
| Converted pervious: Native to lawn | 0 sq. feet |
| Converted pervious: Native to pastu | re 0 sq. feet |
| Total Area of Land Disturbance | 9,000 square feet |

The existing property has greater than 35% (42.0%) imperious coverage and the total proposed project new plus replaced impervious surfaces will be greater than 5,000 (5,814) square feet; using Figure I-2.4.2 – "*Flow Chart for Determining Minimum Requirements for Redevelopment*" page 38, 2014 Stormwater Management Manual for Western Washington, Minimum Requirements #1 - #9 apply to this project.

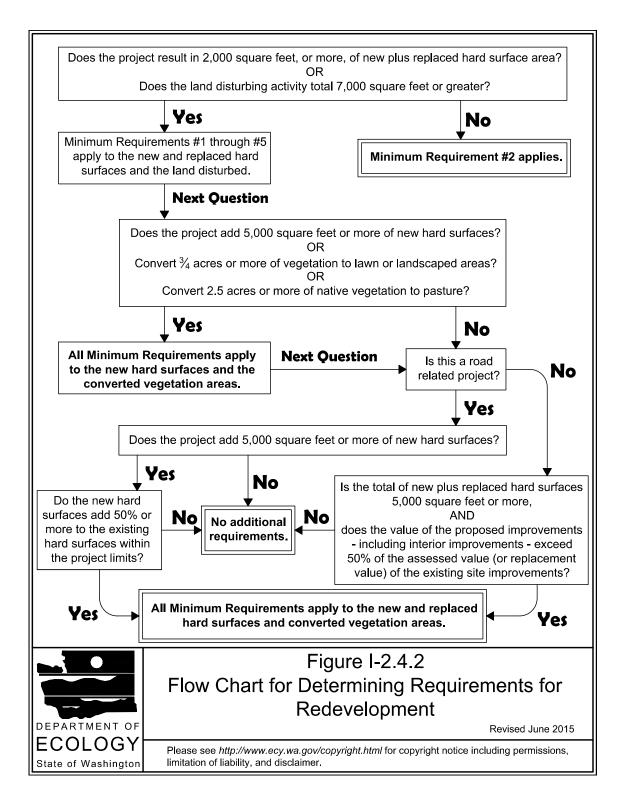

FLOW CHART FIGURE II-2.4.1

Figure I-2.4.1 Flow Chart for Determining Requirements for New Development

2014 Stormwater Management Manual for Western Washington Volume I - Chapter 2 - Page 37

Figure I-2.4.2 Flow Chart for Determining Requirements for Redevelopment

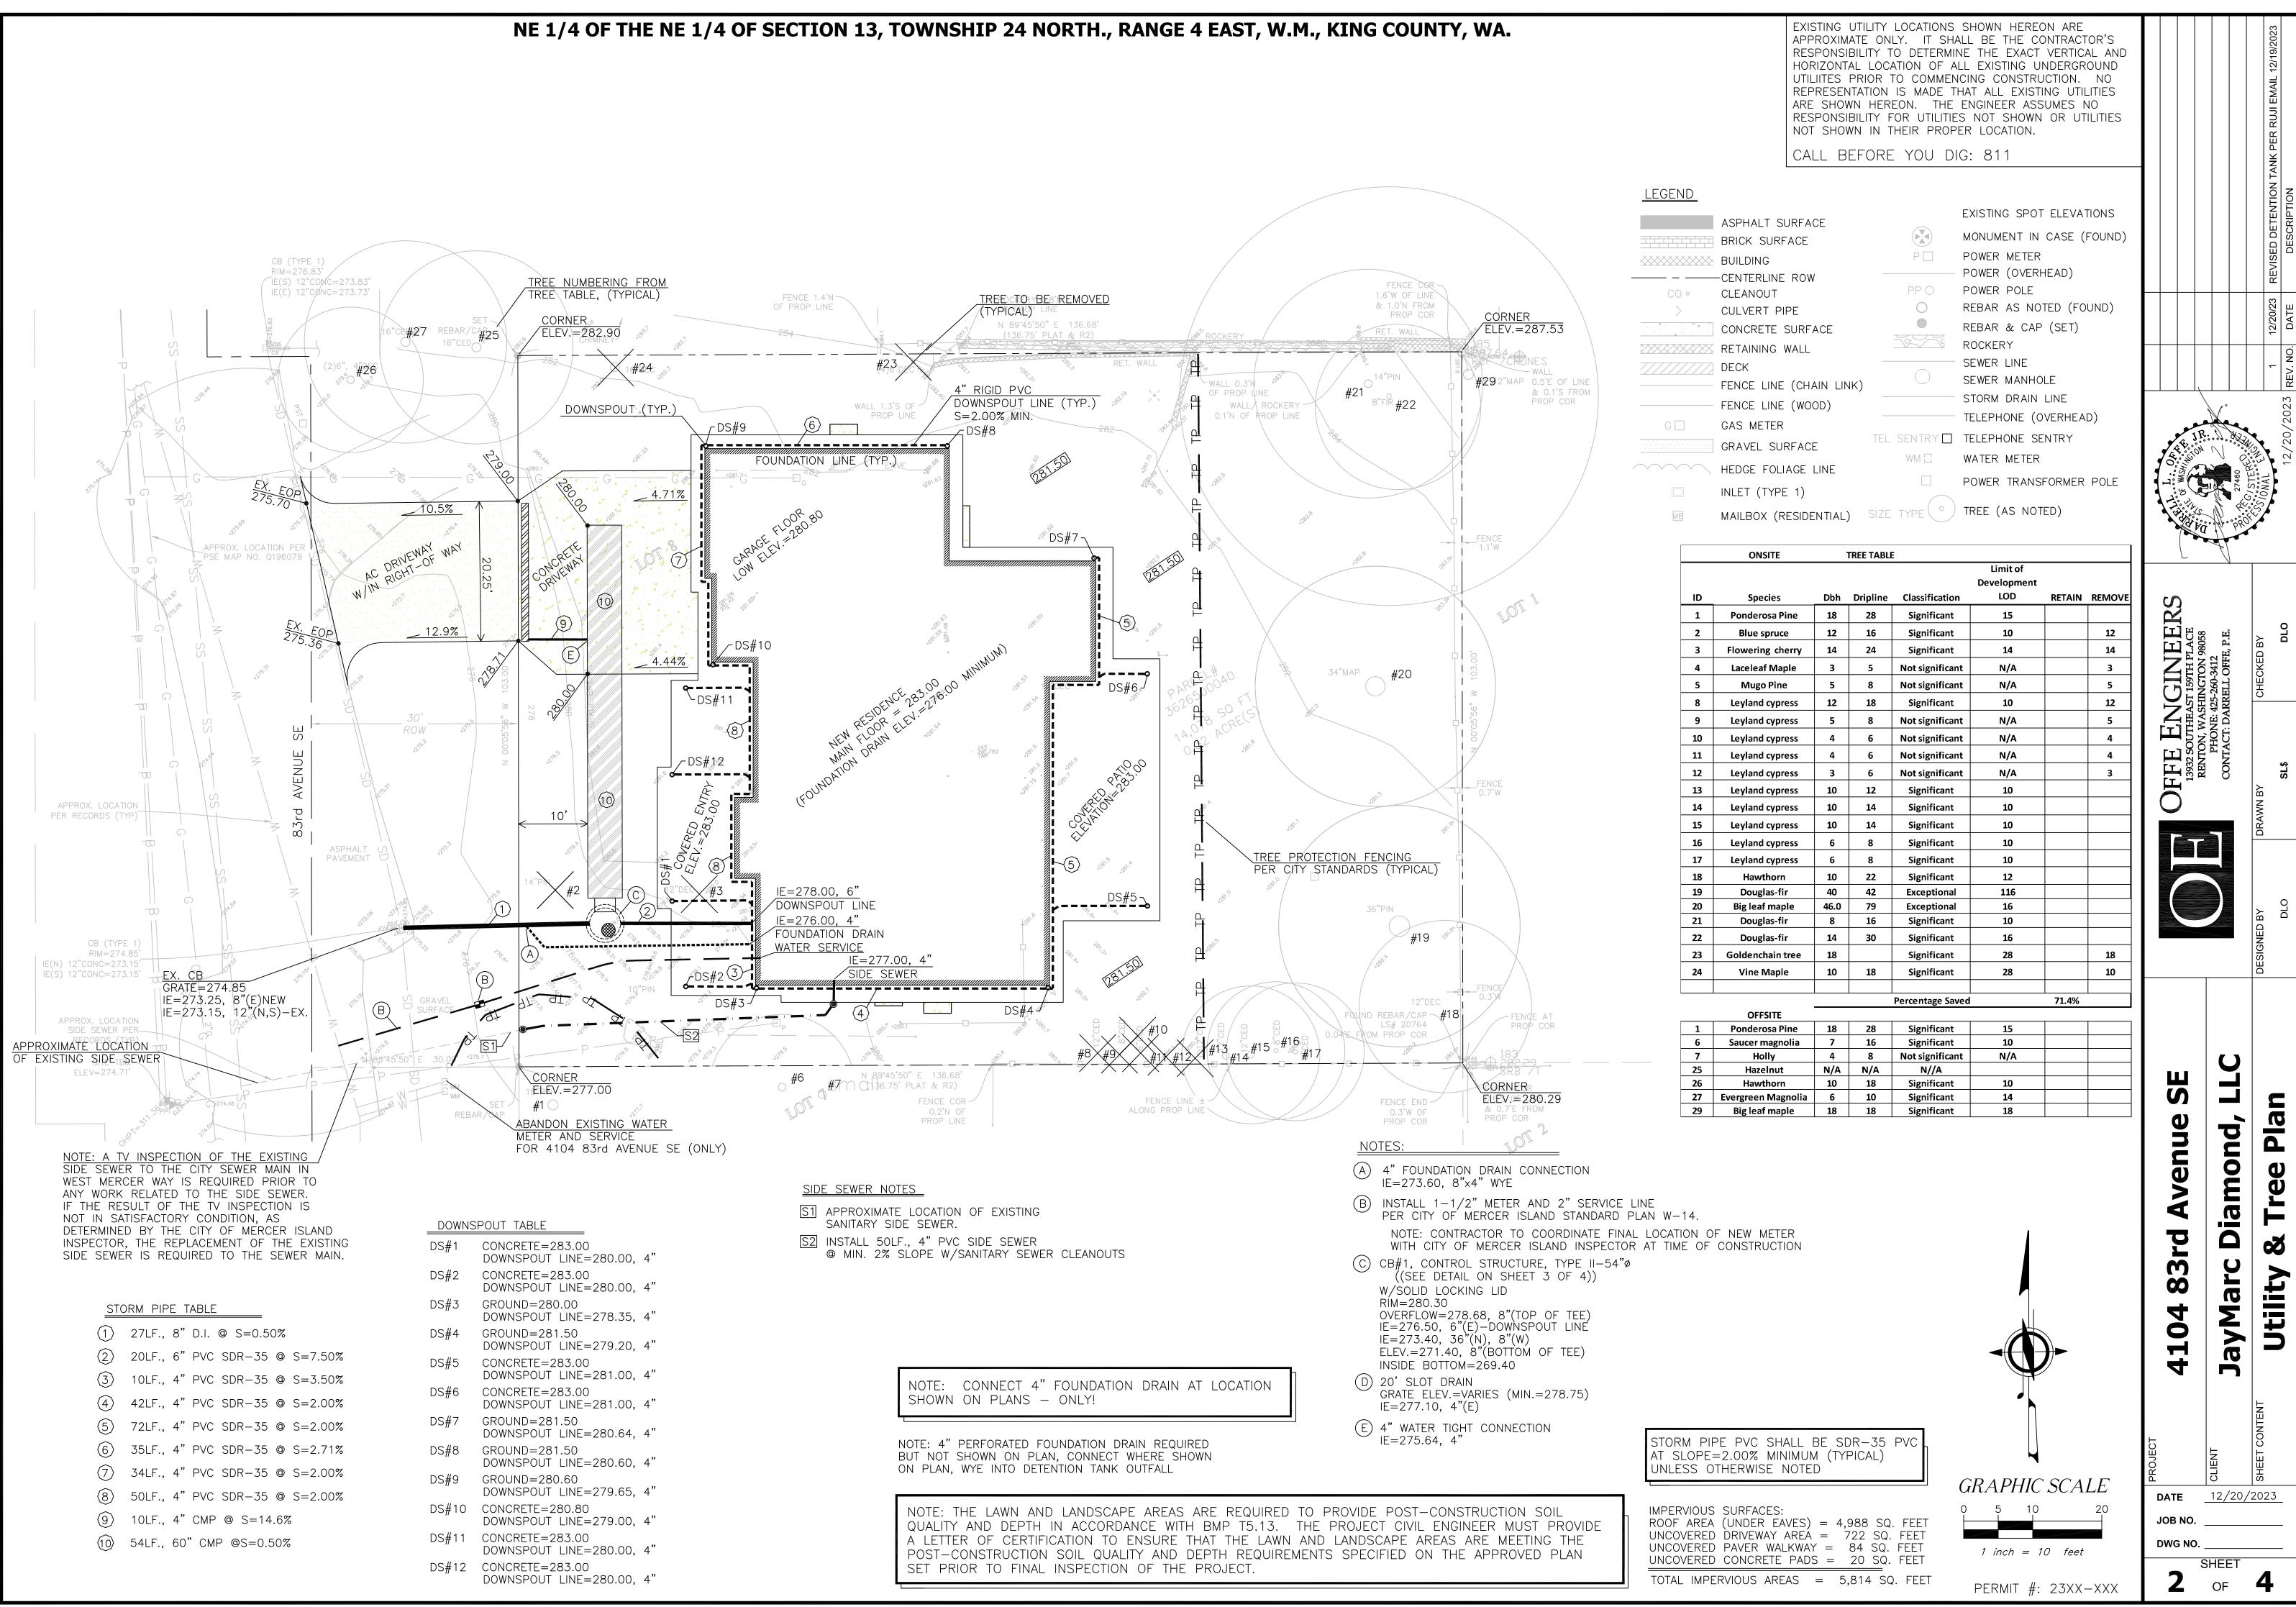

2014 Stormwater Management Manual for Western Washington Volume I - Chapter 2 - Page 38

Section 3: Minimum Requirements Based upon the Flow Chart Figure I-2.4.1 and I-2.4.2 (Amended December 2014 SWMMWW, DOE Manual), all Minimum Requirements 1-9 apply to this project.

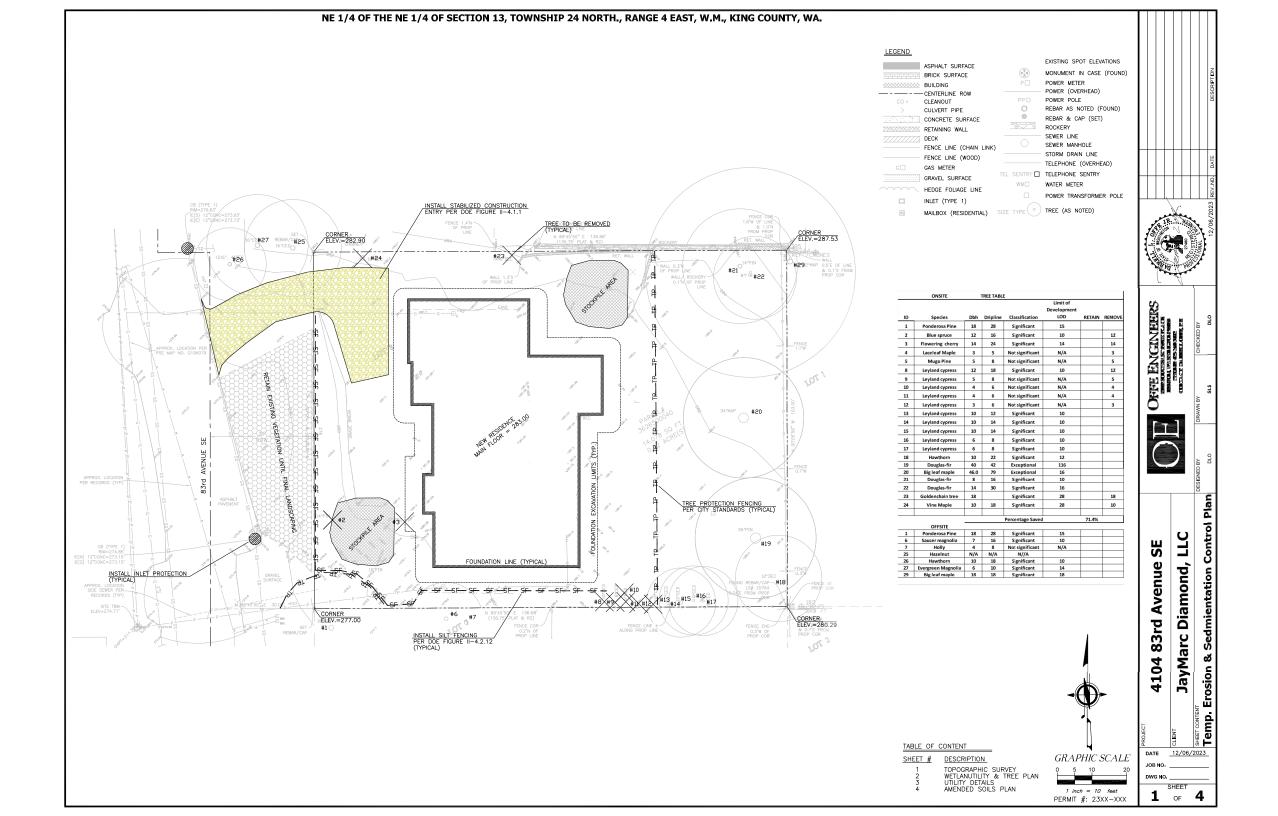

Section I-2.5.1 Minimum Requirement #1 – Preparation of Stormwater Site Plans

A Stormwater site plan (drainage plan) has been prepared for this project together with construction details for installation of the proposed drainage control system. The Stormwater site plans and drainage narrative shall be submitted and reviewed by the City of Mercer Island as part of the building permit application.

Section I-2.5.2 Minimum Requirement #2 - Construction Storm Water Pollution Prevention Plan (CSWPP)

A Construction Stormwater Pollution Prevention Plan (CSWPP) has been prepared and included within this Report. The CSWPP plan shall include construction installation of erosion control, establish a construction access, preservation of existing vegetation during construction, and protection of existing drainage inlets. This will include but not limited to: the use of the existing asphalt driveway (on the north side) to provide construction access from 83rd Avenue SE; installing filter fabric silt fencing along the down gradient property lines (west and south); installation of filter socks within the public catch basins located within 83rd Avenue SE; retention of native vegetated areas including tree/vegetation retention within the rear (east) and front (west) yards; and the use straw or chipped materials placed over exposed disturbed soils to prevent runoff from carrying solids.

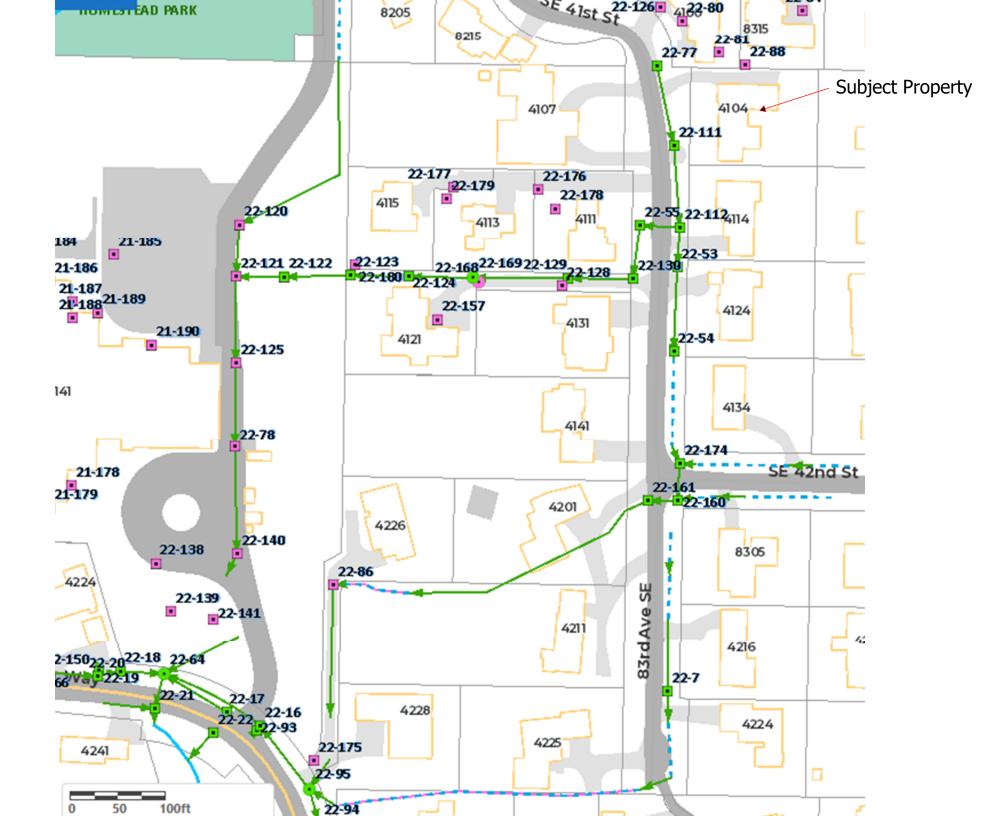

Section I-2.5.3 Minimum Requirement #3 - Source Control of Pollution

Source control BMP's will be utilized to contain pollution generating runoff. No concrete washout will be allowed on the property during construction. No fuel materials will be placed or stored on site during construction.

Section I-2.5.4 Minimum Requirement #4 - Preservation of Natural Drainage Systems and Outfalls

The subject property slopes from a high point at the northeast corner (at elevation 287.53) towards the southwest corner (at elevation 277.00). The existing house roof area discharges onto the ground with splash blocks and then sheet flows over the landscape area and into 83^{rd} Avenue SE. The existing driveway sheet flows towards the shoulder of 83^{rd} Avenue SE. Both these areas combine within catch basin (CB#22-111 – Photo #4) within 83^{rd} Avenue SE at the southwest corner. The natural discharge and outfall from the subject property is sheet flow and collection by a public storm basin in the southwest corner of the property. The proposed discharge will be to convey the onsite drainage from the driveway and roof area within a storm pipe and connect to CB#22-111. The natural outfall has been preserved by the new development.

The subject property was visited in September and November 2023 to review and evaluate onsite drainage patterns and walk and review the downstream system. The downstream system consists of catch basins and conveyance pipes before discharging into a ravine on the south side of West Mercer Way. The downstream, where accessible, has no indications of flooding, overtopping, scouring.

Photo #9 – View from school access towards West Mercer Way – CB#22-16

Photo #10 - CB#22-21

Photo #11 – View from Cb#22-21 towards south – drainage channel

Section I-2.5.5 Minimum Requirement #5 - On-Site Stormwater Management

The proposed project drainage shall be evaluated using "*List #2, On-Site Stormwater Management BMPs for projects triggering Minimum Requirements #1 - #9"*– DOE Volume 1, chapter 2, pages 57 - 58. A Geotechnical Evaluation was prepared by Cobalt Geosciences and is attached to this Report in Appendix A.

List #2

Lawn and landscape areas – **feasible** - The use of Post-Construction Soil Quality and Depth shall be implemented within areas of the property that are not covered by hard surfaces and were disturbed during condition.

Roofs:

1.a. Full Dispersion BMP T5.30 – *infeasible* due to lack of available 100' of vegetated flow path downgradient from the roof area.

1.b. Full Infiltration BMP T5.10A – infeasible due to lack of permeable soils.

2. Rain Garden/Bioretention BMP T7.30 – *infeasible* due to lack of available area on the downgradient portion of the property (west side) and preserved tree area on the west side. Can not remove trees in this area nor work under.

3. Downspout Dispersion System BMP T5.10B – *infeasible* due to lack of available 50' flow path downgradient of the downspout leaders.

4. Perforated Pipe Connection BMP T5.10C - infeasible due to lack of permeable soils.

Other Hard Surfaces:

1. Full Dispersion BMP T5.30 – *infeasible* due to the lack of available 100' of vegetated flow path length.

2. Permeable Pavement BMP T5.15 – infeasible infiltration type BMP not recommended by City of Mercer Island Infiltration Infeasibility Map.

3. Rain Garden/Bioretention BMP T7.30 – infeasible due to lack of available area on the downgradient portion of the property (west side) and preserved tree area on the west side. Can not remove trees in this area nor work under.

4.a. Sheet Flow Dispersion BMP T5.12 – infeasible due to lack of available 25 feet of flow path downgradient from driveway.

4.b. Concentrated Flow Dispersion BMP T5.11 - *infeasible* due to lack of available flow path downgradient from hard surfaces.

There are no available BMPs to provide treatment of the roof area or other hard surfaces. Therefore, a connection to the public storm system within 83rd Avenue Se will be provided.

Section I-2.5.6 Minimum Requirement #6 – Runoff Treatment

Determine if thresholds for runoff treatment have been exceeded:

- (a) Projects that exceed 5,000 square feet of pollution generating hard surfaces (PGHS)

 The proposed project will generate 722 square feet of PGHS threshold not exceeded
- (b) Projects that create or modify ³/₄ acre (32,670 square feet) of pollution generating pervious surface (PGPS) – The proposed project will create or modify 4,350 square feet (1/10 acre) of PGPS – threshold not exceeded.

The thresholds for runoff treatment have not been exceeded, therefore proposed project does not have to provided runoff treatment.

Section I-2.5.7 Minimum Requirement #7 – Flow Control

Determine if thresholds for flow control have been exceeded:

Thresholds:

- (a) Project effective impervious surfaces exceed 10,000 square feet Proposed project will create 5,814 square feet of effective impervious surfaces – threshold not exceeded.
- (b) *Project converts ¾ acre of vegetation to lawn or landscape area* Proposed project will convert 1/10 acre to landscape area threshold not exceeded.
- (c) *Project will cause a 0.10 cfs increase in the 100-year event between the existing condition and the proposed condition* Project modeling will be required to determine if there is an increase in the 100-year event that exceeds threshold.

Modeling: Using WWHM model

Existing condition input:

Roof area (flat) – 0.0851 acres Driveway (moderate) – 0.0359 acres Walkways/patio (flat) – 0.0156 acres Lawn (moderate) – 0.1866 acres

Mitigated condition (proposed) input:

Roof area (moderate) – 0.1145 acres Driveway (moderate) – 0.0166 acres Walkways/pads (flat) – 0.0024 acres Lawn (moderate) – 0.1897 acres

WWMH Modeling can be found within Appendix B.

Modeling results: 100-year existing = 0.1754 cfs 100-year mitigated = 0.1747 cfs

Project will reduce the 100-year event, therefore threshold not exceeded

No flow control thresholds will be exceeded; therefore, DOE flow control is not required. However, City of Mercer Island (MI) does require flow control. Calculations for MI flow control is attached.

Detention Tank sizing per Mercer Island Requirements

Sizing of required for on-site detention system

- (A) The Geotechnical Evaluation by Cobalt Geosciences has determined the underlying soils type to be Class B
- (B) The proposed total impervious surface is 5,814 square feet

Using "*City of Mercer Island On-Site Detention Design Requirements, Table 1*", the required detention tank will be 54 linear feet of 60" (5') CMP pipe.

Notes:

• Minimum Requirement #7 (Flow Control) is required when the 100-year flow frequency causes a 0.15 cubic feet per second increase (when modeled in WWHM with a 15-minute timestep). Breakpoints shown in this table are based on a flat slope (0-5%). The 100-year flow frequency will need to be evaluated on a site-specific basis for projects on moderate (5-15%) or steep (> 15%) slopes.

- Soil type to be determined by geotechnical analysis or soil map.
- Sizing includes a Volume Correction Factor of 120%.
- Upper bound contributing area used for sizing.
- ⁽¹⁾ On Type B soils, new plus replaced impervious surface areas exceeding 8,500 sf trigger Minimum Requirement #7 (Flow Control)
- ⁽²⁾ On Type C soils, new plus replaced impervious surface areas exceeding 9,500 sf trigger Minimum Requirement #7 (Flow Control)
- ⁽³⁾ Minimum orifice diameter = 0.5 inches
- in = inch
- ft = feet
- sf = square feet

Basis of Sizing Assumptions:

Sized per MR#5 in the Stormwater Management Manual for Puget Sound Basin (1992 Ecology Manual) SBUH, Type 1A, 24-hour hydrograph 2-year, 24-hour storm = 2 in; 10-year, 24-hour storm = 3 in; 100-year, 24-hour storm = 4 in Predeveloped = second growth forest (CN = 72 for Type B soils, CN = 81 for Type C soils) Developed = impervious (CN = 98) 0.5 foot of sediment storage in detention pipe Overland slope = 5%

|--|
| RATION AND MAINTANANCE OF DRAINAGE SYSTEMS ON PRIVATE LITY OF THE PROPERTY OWNER. MATERIAL ACCUMULATED IN THE REMOVED FROM CATCH BASINS TO ALLOW PROPER OPERATION. RFICE MUST BE KEPT OPEN AT ALL TIMES. |
| D PROTECTIVE TREATMENT SHALL BE IN ACCORDANCE WITH SECTION NSDOT STANDARD SPECIFICATION FOR ROAD, BRIDGE, AND MUNICIPAL ERSION. SUCH MATERIALS INCLUDE THE FOLLOWING, LINED NE PIPE (LCPE), ALUMINIZED TYPE 2 CORRUGATED STEEL PIPE AND TO DESIGNATIONS M274 AND M36), CORRUGATED OR SPIRAL RIB FORCED CONCRETE PIPE. CORRUGATED STEEL PIPE IS NOT ALLOWED. |
| IOT BE CONNECTED TO THE DETENTION SYSTEM. |

Section I-2.5.8 Minimum Requirement #8 – Wetlands Protection

Proposed project does not discharge into a wetland; therefore, Minimum Requirement #8 dopes not apply.

Section I-2.5.9 Minimum Requirement #9 – Operation and Maintenance Attached

Table V-4.5.2(3) Maintenance Standards - Closed Detention Systems(Tanks/Vaults)

| Maintenance Component | Detect | Conditions When Maintenance is Needed | Results Expec- ted When Maintenance is Performed |
|--------------------------|---|--|---|
| | Plugged Air Vents | One-half of the cross section of a vent is blocked at any point or the vent is damaged. | Vents open and functioning. |
| | Debris and Sed- iment | Accumulated sediment depth exceeds 10% of the diameter of the storage area for 1/2 length of storage vault or any point depth exceeds 15% of diameter. | All sediment and debris |
| | | (Example: 72-inch storage tank would require cleaning when sediment reaches depth of 7 inches for more than 1/2 length of tank.) | removed from storage area. |
| | Joints Between Tank/Pipe Sec- tion | Any openings or voids allowing mater- ial to be transported into facility. | All joint between |
| | | (Will require engineering analysis to determine structural stability). | tank/pipe sec- tions are sealed. |
| | Tank Pipe Bent Out of Shape | Any part of tank/pipe is bent out of shape more than 10% of its design shape. (Review required by engineer to determine structural stability). | Tank/pipe repaired or replaced to design. |
| | Vault Structure Includes Cracks in Wall, Bottom, Damage to Frame and/or Top Slab | Cracks wider than 1/2-inch and any evidence of soil particles entering the structure through the cracks, or main- tenance/inspection personnel determ- ines that the vault is not structurally sound. | Vault replaced or repaired to design spe- cifications and is structurally sound. |
| | | Cracks wider than 1/2-inch at the joint of any inlet/outlet pipe or any evidence of soil particles entering the vault through the walls. | No cracks more than 1/4-inch wide at the joint of the inlet/out- let pipe. |
| Manhole | Cover Not in Place | Cover is missing or only partially in place. Any open manhole requires maintenance. | Manhole is closed. |

2014 Stormwater Management Manual for Western Washington

Table V-4.5.2(3) Maintenance Standards - Closed Detention Systems(Tanks/Vaults) (continued)

| Maintenance Component | Defect | Conditions When Maintenance is Needed | Results Expec- ted When Maintenance is Performed |
|--------------------------|---------------------------------|---|--|
| | anism Not Work- ing | Bolts into frame have less than 1/2 inch | Mechanism opens with proper tools. |
| | Cover Difficult to Remove | One maintenance person cannot remove lid after applying normal lifting pressure. Intent is to keep cover from sealing off access to maintenance. | Cover can be removed and reinstalled by one main- tenance per- son. |
| | Ladder Rungs Unsafe | Ladder is unsafe due to missing rungs, misalignment, not securely attached to structure wall, rust, or cracks. | Ladder meets design stand- ards. Allows maintenance person safe access. |
| Catch Basins | See "Catch Bas- ins" (No. 5) | See "Catch Basins" (No. 5). | See "Catch Basins" (No. 5). |

Table V-4.5.2(4) Maintenance Standards - Control Structure/Flow

Restrictor

| | nestrictor | | | | | |
|--------------------------|---|--|---|--|--|--|
| Maintenance Component | Detect | Condition When Main- tenance is Needed | Results Expected When Maintenance is Performed | | | |
| General | Trash and Debris (Includes Sediment) | Material exceeds 25% of sump depth or 1 foot below orifice plate. | Control structure orifice is not blocked. All trash and debris removed. | | | |
| | | Structure is not securely attached to manhole wall. | Structure securely attached to wall and outlet pipe. | | | |
| | Structural Damage | Structure is not in upright position (allow up to 10% from plumb). Connections to outlet pipe | Structure in correct position. Connections to outlet pipe are water tight; structure repaired or replaced and works as | | | |

Table V-4.5.2(4) Maintenance Standards - Control Structure/FlowRestrictor (continued)

| Maintenance | Defect | Condition When Main- | Results Expected When |
|------------------|--|--|--|
| Component | Defect | tenance is Needed | Maintenance is Performed |
| | | are not watertight and show signs of rust. | designed. |
| | | Any holes - other than designed holes - in the structure. | Structure has no holes other than designed holes. |
| | | Cleanout gate is not water- tight or is missing. | Gate is watertight and works as designed. |
| Cleanout | Damaged or Missing | Gate cannot be moved up and down by one main- tenance person. | Gate moves up and down eas- ily and is watertight. |
| Gate | | Chain/rod leading to gate is missing or damaged. | Chain is in place and works as designed. |
| | | Gate is rusted over 50% of its surface area. | Gate is repaired or replaced to meet design standards. |
| Orifice Plate | Damaged or Missing | Control device is not work- ing properly due to missing, out of place, or bent orifice plate. | Plate is in place and works as designed. |
| | Obstructions | Any trash, debris, sediment, or vegetation blocking the plate. | Plate is free of all obstructions and works as designed. |
| Overflow Pipe | Obstructions | Any trash or debris blocking (or having the potential of blocking) the overflow pipe. | Pipe is free of all obstructions and works as designed. |
| Manhole | See "Closed Detention Systems" (No. 3). | See "Closed Detention Sys- tems" (No. 3). | See "Closed Detention Sys- tems" (No. 3). |
| Catch Basin | See "Catch Basins" (No. 5). | See "Catch Basins" (No. 5). | See "Catch Basins" (No. 5). |

| | | Maintenance Standards - Catch Das | |
|--------------------------|--|---|--|
| Maintenance Component | Defect | Conditions When Maintenance is Needed | Results Expected When Main- tenance is performed |
| General | Trash & Debris | Trash or debris which is located imme- diately in front of the catch basin opening or is blocking inletting capacity of the basin by more than 10%. Trash or debris (in the basin) that exceeds 60 percent of the sump depth as measured from the bottom of basin to invert of the low- est pipe into or out of the basin, but in no case less than a minimum of six inches clearance from the debris surface to the invert of the lowest pipe. Trash or debris in any inlet or outlet pipe blocking more than 1/3 of its height. Dead animals or vegetation that could gen- erate odors that could cause complaints or dangerous gases (e.g., methane). | No Trash or debris loc- ated imme- diately in front of catch basin or on grate open- ing. No trash or debris in the catch basin. Inlet and out- let pipes free of trash or debris. No dead animals or vegetation present within the catch basin. |
| | | Sediment (in the basin) that exceeds 60 per- cent of the sump depth as measured from the bottom of basin to invert of the lowest pipe into or out of the basin, but in no case less than a minimum of 6 inches clearance from the sediment surface to the invert of the lowest pipe. | No sediment in the catch |
| | Structure Damage to Frame and/or Top Slab | Top slab has holes larger than 2 square inches or cracks wider than 1/4 inch. (Intent is to make sure no material is running into basin). | Top slab is free of holes and cracks. Frame is sit- |

Table V-4.5.2(5) Maintenance Standards - Catch Basins

2014 Stormwater Management Manual for Western Washington

| | | enance Standards - Catch Basins (c | , |
|--------------------------|---|---|--|
| Maintenance Component | Detect | Conditions When Maintenance is Needed | Results Expected When Main- tenance is performed |
| | | Frame not sitting flush on top slab, i.e., sep- aration of more than 3/4 inch of the frame from the top slab. Frame not securely attached | ting flush on the riser rings or top slab and firmly attached. |
| | Fractures or Cracks in Basin Walls/ Bottom | Maintenance person judges that structure is unsound. Grout fillet has separated or cracked wider than 1/2 inch and longer than 1 foot at the joint of any inlet/outlet pipe or any evidence | Basin replaced or repaired to design stand- ards. Pipe is |
| | Bollom | of soil particles entering catch basin through cracks. | regrouted and secure at basin wall. |
| | | If failure of basin has created a safety, func- tion, or design problem. | Basin replaced or repaired to design stand- ards. |
| | Vegetation | Vegetation growing across and blocking more than 10% of the basin opening. | No veget- ation block- ing opening to basin. |
| | | Vegetation growing in inlet/outlet pipe joints that is more than six inches tall and less than six inches apart. | No veget- ation or root growth present. |
| | Contamination and Pollution | See "Detention Ponds" (No. 1). | No pollution present. |

Appendix A: Geotechnical Evaluation

Cobalt Geosciences, LLC P.O. Box 1792 North Bend, WA 98045

November 13, 2023

JayMarc Homes C/O Darrell Offe <u>Darrell.offe@comcast.net</u>

RE: Geotechnical Evaluation Proposed Residence 4104 83rd Avenue SE Mercer Island, Washington

In accordance with your authorization, Cobalt Geosciences, LLC has prepared this letter to discuss the results of our geotechnical evaluation at the referenced site.

The purpose of our evaluation was to provide recommendations for foundation design, grading, and earthwork.

Site Description

The site is located at 4104 83rd Avenue SE in Mercer Island, Washington. The site consists of one nearly rectangular parcel (No. 3626500040) with a total area of 14,085 square feet.

The central portion of the property is developed with a residence and driveway. The site slopes downward from northeast and east to west and southwest at magnitudes of about 5 to 15 percent and relief of about 10 feet. There is a short cut slope about 4 feet tall and at magnitudes of over 50 percent near the west property line and right of way. There is an apparent wall near the north property line that is about 6 feet tall and 15 feet long (obscured by vegetation).

The site is vegetated with grasses, bushes, and variable diameter trees. The site is bordered to the north, south, and east by residences, and to the west by 83rd Avenue SE.

The proposed development includes a new residence and driveway in the central portion of the property.

Stormwater will include infiltration or other systems depending on feasibility. Site grading may include cuts and fills of 3 feet or less and foundation loads are expected to be light. We should be provided with the final plans to verify that our recommendations remain valid and do not require updating.

Area Geology

The <u>Geologic map of the Mercer Island</u>, indicates that the site is underlain by Vashon Glacial Till.

Vashon Glacial Till includes dense mixtures of silt, sand, gravel, and clay. These deposits are typically impermeable below a weathered zone.

Soil & Groundwater Conditions

As part of our evaluation, we excavated two hand borings where accessible. The explorations encountered approximately 6 inches of grass and topsoil underlain by approximately 3.25 to 4.25 feet of loose to medium dense, silty-fine to medium grained sand with gravel (Weathered Glacial

Till). These materials were underlain by dense, silty-fine to medium grained gravel (Glacial Till), which continued to the termination depths of the explorations.

Groundwater was not encountered during the exploration work. Perched groundwater may develop within 5 feet of the existing site elevations during the wet season based on the presence of soil mottling. Volumes would generally be light.

Water table elevations often fluctuate over time. The groundwater level will depend on a variety of factors that may include seasonal precipitation, irrigation, land use, climatic conditions and soil permeability. Water levels at the time of the field investigation may be different from those encountered during the construction phase of the project. It would be necessary to install a piezometer to determine groundwater depths over a typical year.

Seismic Parameters

The overall subsurface profile corresponds to a Site Class D as defined by Table 1613.5.2 of the International Building Code (IBC). A Site Class D applies to an overall profile consisting of medium dense to very dense soils within the upper 100 feet.

We referenced the U.S. Geological Survey (USGS) Earthquake Hazards Program Website to obtain values for S_S , S_1 , F_a , and F_v . The USGS website includes the most updated published data on seismic conditions. The following tables provide seismic parameters from the USGS web site with referenced parameters from ASCE 7-16.

| Site Class | Spectral Acceleration at 0.2 sec. (g) | Spectral Acceleration at 1.0 sec. (g) | ation Coefficients | | | Design Spectral Response Parameters | | |
|---------------|---|---|--------------------|---------|----------------------------|--|-------|--|
| | | | Fa | F_{v} | \mathbf{S}_{DS} | S_{D1} | | |
| D | 1.418 | 0.493 | 1.0 | Null | 0.945 | Null | 0.607 | |

Seismic Design Parameters (ASCE 7-16)

Additional seismic considerations include liquefaction potential and amplification of ground motions by soft/loose soil deposits. The liquefaction potential is highest for loose sand with a high groundwater table. The site has a relatively low likelihood of liquefaction. For items listed as "Null" see Section 11.4.8 of the ASCE.

Conclusions and Recommendations

General

The site is underlain by soils consistent with Vashon Glacial Till. These soils become relatively dense below a weathered zone. The proposed residential structure may be supported on a shallow foundation system bearing on medium dense or firmer native soils or on structural fill placed on the native soils.

Local overexcavation or recompaction of loose weathered native soils may be necessary depending on the proposed elevations and locations of the new footings. Widespread infiltration is not feasible due to the soil conditions and anticipated seasonal groundwater conditions. We recommend utilizing direct or perforated connection to an approved conveyance.

Site Preparation

Trees, shrubs and other vegetation should be removed prior to stripping of surficial organic-rich soil and fill. Based on observations from the site investigation program, it is anticipated that the stripping depth will be 6 to 18 inches. Deeper excavations will be necessary below larger trees and foundation systems.

The native soils consist of silty-sand with gravel. Most of the native soils may be used as structural fill provided they achieve compaction requirements and are within 3 percent of the optimum moisture. Some of these soils may only be suitable for use as fill during the summer months, as they will be above the optimum moisture levels in their current state. These soils are variably moisture sensitive and may degrade during periods of wet weather and under equipment traffic.

Imported structural fill should consist of a sand and gravel mixture with a maximum grain size of 3 inches and less than 5 percent fines (material passing the U.S. Standard No. 200 Sieve). Structural fill should be placed in maximum lift thicknesses of 12 inches and should be compacted to a minimum of 95 percent of the modified proctor maximum dry density, as determined by the ASTM D 1557 test method.

Temporary Excavations

Based on our understanding of the project, we anticipate that the grading could include local cuts on the order of approximately 3 feet or less for foundation and most of the utility placement. Temporary excavations should be sloped no steeper than 1.5H:1V (Horizontal:Vertical) in loose native soils and fill, 1H:1V in medium dense native soils and 3/4H:1V in dense to very dense native soils (if encountered). If an excavation is subject to heavy vibration or surcharge loads, we recommend that the excavations be sloped no steeper than 2H:1V, where room permits.

Temporary cuts should be in accordance with the Washington Administrative Code (WAC) Part N, Excavation, Trenching, and Shoring. Temporary slopes should be visually inspected daily by a qualified person during construction activities and the inspections should be documented in daily reports. The contractor is responsible for maintaining the stability of the temporary cut slopes and reducing slope erosion during construction.

Temporary cut slopes should be covered with visqueen to help reduce erosion during wet weather, and the slopes should be closely monitored until the permanent retaining systems or slope configurations are complete. Materials should not be stored or equipment operated within 10 feet of the top of any temporary cut slope.

Soil conditions may not be completely known from the geotechnical investigation. In the case of temporary cuts, the existing soil conditions may not be completely revealed until the excavation work exposes the soil. Typically, as excavation work progresses the maximum inclination of temporary slopes will need to be re-evaluated by the geotechnical engineer so that supplemental recommendations can be made. Soil and groundwater conditions can be highly variable. Scheduling for soil work will need to be adjustable, to deal with unanticipated conditions, so that the project can proceed and required deadlines can be met.

If any variations or undesirable conditions are encountered during construction, we should be notified so that supplemental recommendations can be made. If room constraints or groundwater conditions do not permit temporary slopes to be cut to the maximum angles allowed by the WAC, temporary shoring systems may be required. The contractor should be responsible for developing temporary shoring systems, if needed. We recommend that Cobalt Geosciences and the project structural engineer review temporary shoring designs prior to installation, to verify the suitability of the proposed systems.

Foundation Design

The proposed structure may be supported on a shallow spread footing foundation system bearing on undisturbed medium dense or firmer native soils or on properly compacted structural fill placed on the suitable native soils. Any undocumented fill and/or loose native soils should be removed and replaced with structural fill below foundation elements. Structural fill below footings should consist of clean angular rock 5/8 to 4 inches in size. We should verify soil conditions during foundation excavation work.

For shallow foundation support, we recommend widths of at least 16 and 24 inches, respectively, for continuous wall and isolated column footings supporting the proposed structure. Provided that the footings are supported as recommended above, a net allowable bearing pressure of 2,500 pounds per square foot (psf) may be used for design.

A 1/3 increase in the above value may be used for short duration loads, such as those imposed by wind and seismic events. Structural fill placed on bearing, native subgrade should be compacted to at least 95 percent of the maximum dry density based on ASTM Test Method D1557. Footing excavations should be inspected to verify that the foundations will bear on suitable material.

Exterior footings should have a minimum depth of 18 inches below pad subgrade (soil grade) or adjacent exterior grade, whichever is lower. Interior footings should have a minimum depth of 12 inches below pad subgrade (soil grade) or adjacent exterior grade, whichever is lower.

If constructed as recommended, the total foundation settlement is not expected to exceed 1 inch. Differential settlement, along a 25-foot exterior wall footing, or between adjoining column footings, should be less than $\frac{1}{2}$ inch. This translates to an angular distortion of 0.002. Most settlement is expected to occur during construction, as the loads are applied. However, additional post-construction settlement may occur if the foundation soils are flooded or saturated. All footing excavations should be observed by a qualified geotechnical consultant.

Resistance to lateral footing displacement can be determined using an allowable friction factor of 0.40 acting between the base of foundations and the supporting subgrades. Lateral resistance for footings can also be developed using an allowable equivalent fluid passive pressure of 250 pounds per cubic foot (pcf) acting against the appropriate vertical footing faces (neglect the upper 12 inches below grade in exterior areas). The frictional and passive resistance of the soil may be combined without reduction in determining the total lateral resistance.

Care should be taken to prevent wetting or drying of the bearing materials during construction. Any extremely wet or dry materials, or any loose or disturbed materials at the bottom of the footing excavations, should be removed prior to placing concrete. The potential for wetting or drying of the bearing materials can be reduced by pouring concrete as soon as possible after completing the footing excavation and evaluating the bearing surface by the geotechnical engineer or his representative.

Stormwater Management Feasibility

The site is underlain by weathered and unweathered glacial soil deposits. We evaluated the infiltration characteristics in HB-2 at a depth of 4 feet below grade.

We attempted to perform an in-situ infiltration test; however, during the saturation period, the inflow of testing water was reduced to the lowest possible rate and the water level in the exploration consistently increased. This indicates that vertical infiltration was reduced to near zero, confirming infiltration infeasibility due to the presence of an aquitard.

We recommend direct or perforated connection of runoff collection devices to City infrastructure. We can provide additional input if other systems are being considered or proposed.

Slab-on-Grade

We recommend that the upper 18 inches of the existing native soils within slab areas be recompacted to at least 95 percent of the modified proctor (ASTM D1557 Test Method).

Often, a vapor barrier is considered below concrete slab areas. However, the usage of a vapor barrier could result in curling of the concrete slab at joints. Floor covers sensitive to moisture typically requires the usage of a vapor barrier. A materials or structural engineer should be consulted regarding the detailing of the vapor barrier below concrete slabs. Exterior slabs typically do not utilize vapor barriers.

The American Concrete Institutes ACI 360R-06 Design of Slabs on Grade and ACI 302.1R-04 Guide for Concrete Floor and Slab Construction are recommended references for vapor barrier selection and floor slab detailing.

Slabs on grade may be designed using a coefficient of subgrade reaction of 180 pounds per cubic inch (pci) assuming the slab-on-grade base course is underlain by structural fill placed and compacted as outlined above. A 4- to 6-inch-thick capillary break layer should be placed over the prepared subgrade. This material should consist of pea gravel or 5/8 inch clean angular rock.

A perimeter drainage system is recommended unless interior slab areas are elevated a minimum of 12 inches above adjacent exterior grades. If installed, a perimeter drainage system should consist of a 4-inch diameter perforated drain pipe surrounded by a minimum 6 inches of drain rock wrapped in a non-woven geosynthetic filter fabric to reduce migration of soil particles into the drainage system. The perimeter drainage system should discharge by gravity flow to a suitable stormwater system.

Exterior grades surrounding buildings should be sloped at a minimum of one percent to facilitate surface water flow away from the building and preferably with a relatively impermeable surface cover immediately adjacent to the building.

Erosion and Sediment Control

Erosion and sediment control (ESC) is used to reduce the transportation of eroded sediment to wetlands, streams, lakes, drainage systems, and adjacent properties. Erosion and sediment control measures should be implemented, and these measures should be in general accordance with local regulations. At a minimum, the following basic recommendations should be incorporated into the design of the erosion and sediment control features for the site:

• Schedule the soil, foundation, utility, and other work requiring excavation or the disturbance of the site soils, to take place during the dry season (generally May through September).

However, provided precautions are taken using Best Management Practices (BMP's), grading activities can be completed during the wet season (generally October through April).

- All site work should be completed and stabilized as quickly as possible.
- Additional perimeter erosion and sediment control features may be required to reduce the possibility of sediment entering the surface water. This may include additional silt fences, silt fences with a higher Apparent Opening Size (AOS), construction of a berm, or other filtration systems.
- Any runoff generated by dewatering discharge should be treated through construction of a sediment trap if there is sufficient space. If space is limited other filtration methods will need to be incorporated.

Utilities

Utility trenches should be excavated according to accepted engineering practices following OSHA (Occupational Safety and Health Administration) standards, by a contractor experienced in such work. The contractor is responsible for the safety of open trenches. Traffic and vibration adjacent to trench walls should be reduced; cyclic wetting and drying of excavation side slopes should be avoided. Depending upon the location and depth of some utility trenches, groundwater flow into open excavations could be experienced, especially during or shortly following periods of precipitation.

In general, silty and sandy soils were encountered at shallow depths in the explorations at this site. These soils have low cohesion and density and will have a tendency to cave or slough in excavations. Shoring or sloping back trench sidewalls is required within these soils in excavations greater than 4 feet deep.

All utility trench backfill should consist of imported structural fill or suitable on site soils. Utility trench backfill placed in or adjacent to buildings and exterior slabs should be compacted to at least 95 percent of the maximum dry density based on ASTM Test Method D1557. The upper 5 feet of utility trench backfill placed in pavement areas should be compacted to at least 95 percent of the maximum dry density based on ASTM Test Method D1557. Below 5 feet, utility trench backfill in pavement areas should be compacted to at least 90 percent of the maximum dry density based on ASTM Test Method D1557. Below 5 feet, utility trench backfill in pavement areas should be compacted to at least 90 percent of the maximum dry density based on ASTM Test Method D1557. Pipe bedding should be in accordance with the pipe manufacturer's recommendations.

The contractor is responsible for removing all water-sensitive soils from the trenches regardless of the backfill location and compaction requirements. Depending on the depth and location of the proposed utilities, we anticipate the need to re-compact existing fill soils below the utility structures and pipes. The contractor should use appropriate equipment and methods to avoid damage to the utilities and/or structures during fill placement and compaction procedures.

CONSTRUCTION FIELD REVIEWS

Cobalt Geosciences should be retained to provide part time field review during construction in order to verify that the soil conditions encountered are consistent with our design assumptions and that the intent of our recommendations is being met. This will require field and engineering review to:

- Monitor and test structural fill placement and soil compaction
- Observe bearing capacity at foundation locations

- Observe slab-on-grade preparation
- Monitor foundation drainage placement
- Observe excavation stability

Geotechnical design services should also be anticipated during the subsequent final design phase to support the structural design and address specific issues arising during this phase. Field and engineering review services will also be required during the construction phase in order to provide a Final Letter for the project.

CLOSURE

This report was prepared for the exclusive use of JayMarc Homes and their appointed consultants. Any use of this report or the material contained herein by third parties, or for other than the intended purpose, should first be approved in writing by Cobalt Geosciences, LLC.

The recommendations contained in this report are based on assumed continuity of soils with those of our test holes and assumed structural loads. Cobalt Geosciences should be provided with final architectural and civil drawings when they become available in order that we may review our design recommendations and advise of any revisions, if necessary.

Use of this report is subject to the Statement of General Conditions provided in Appendix A. It is the responsibility of JayMarc Homes who is identified as "the Client" within the Statement of General Conditions, and its agents to review the conditions and to notify Cobalt Geosciences should any of these not be satisfied.

Sincerely,

Cobalt Geosciences, LLC

11/13/2023 Phil Haberman, PE, LG, LEG Principal

Statement of General Conditions

USE OF THIS REPORT: This report has been prepared for the sole benefit of the Client or its agent and may not be used by any third party without the express written consent of Cobalt Geosciences and the Client. Any use which a third party makes of this report is the responsibility of such third party.

BASIS OF THE REPORT: The information, opinions, and/or recommendations made in this report are in accordance with Cobalt Geosciences present understanding of the site specific project as described by the Client. The applicability of these is restricted to the site conditions encountered at the time of the investigation or study. If the proposed site specific project differs or is modified from what is described in this report or if the site conditions are altered, this report is no longer valid unless Cobalt Geosciences is requested by the Client to review and revise the report to reflect the differing or modified project specifics and/or the altered site conditions.

STANDARD OF CARE: Preparation of this report, and all associated work, was carried out in accordance with the normally accepted standard of care in the state of execution for the specific professional service provided to the Client. No other warranty is made.

INTERPRETATION OF SITE CONDITIONS: Soil, rock, or other material descriptions, and statements regarding their condition, made in this report are based on site conditions encountered by Cobalt Geosciences at the time of the work and at the specific testing and/or sampling locations. Classifications and statements of condition have been made in accordance with normally accepted practices which are judgmental in nature; no specific description should be considered exact, but rather reflective of the anticipated material behavior. Extrapolation of in situ conditions can only be made to some limited extent beyond the sampling or test points. The extent depends on variability of the soil, rock and groundwater conditions as influenced by geological processes, construction activity, and site use.

VARYING OR UNEXPECTED CONDITIONS: Should any site or subsurface conditions be encountered that are different from those described in this report or encountered at the test locations, Cobalt Geosciences must be notified immediately to assess if the varying or unexpected conditions are substantial and if reassessments of the report conclusions or recommendations are required. Cobalt Geosciences will not be responsible to any party for damages incurred as a result of failing to notify Cobalt Geosciences that differing site or sub-surface conditions are present upon becoming aware of such conditions.

PLANNING, DESIGN, OR CONSTRUCTION: Development or design plans and specifications should be reviewed by Cobalt Geosciences, sufficiently ahead of initiating the next project stage (property acquisition, tender, construction, etc), to confirm that this report completely addresses the elaborated project specifics and that the contents of this report have been properly interpreted. Specialty quality assurance services (field observations and testing) during construction are a necessary part of the evaluation of sub-subsurface conditions and site preparation works. Site work relating to the recommendations included in this report should only be carried out in the presence of a qualified geotechnical engineer; Cobalt Geosciences cannot be responsible for site work carried out without being present.

Classification of Soil Constituents

MAJOR constituents compose more than 50 percent, by weight, of the soil. Major constituents are capitalized (i.e., SAND).

Minor constituents compose 12 to 50 percent of the soil and precede the major constituents (i.e., silty SAND). Minor constituents preceded by "slightly" compose 5 to 12 percent of the soil (i.e., slightly silty SAND).

Trace constituents compose 0 to 5 percent of the soil (i.e., slightly silty SAND, trace gravel).
