INTRODUCTION AND BRIEF SITE DESCRIPTION

The subject property is located at 4340 East Mercer Way in the City of Mercer Island, Washington. The King County tax parcel number for the property follows: 004610-0152. Per the King County Assessor's office, the site encompasses approximately 0.49 acres and is currently owned by William Leahy. Vehicular site access to the subject property is gained by travelling west from a private road onto an existing concrete driveway located among the eastern portion of the property. The subject property is currently developed with a single-family residence and associated infrastructure normal to single-family residential properties in the region.

Wetlands & Wildlife, Inc. was retained by Westhill, Inc. to conduct detailed Critical Areas evaluations of the subject property and vicinity pursuant to the requirements outlined in Chapter 19.07 (Environment) of the Mercer Island City Code (MICC). Specifically, Wetlands & Wildlife, Inc. was retained to determine if any wetlands, streams, or associated protective buffer areas regulated by the MICC exist on or near the property. Wetlands & Wildlife, Inc. conducted detailed Critical Areas multiple site visits to the subject property during 2020. Please review the RESULTS AND FINDINGS OF CRITICAL AREAS EVALUATION section of this report for further information. Please also see the attached Critical Areas Overview Map (Map Sheet CA1.00).

STATEMENT OF QUALIFICATIONS TO CONDUCT THIS CRITICAL AREAS EVALUATION

Per requirements outlined in Chapter 19.07 (Environment) of the MICC, a Critical Areas Study shall be prepared by a qualified professional using guidance based on the best available science consistent with the standards in Chapter 365-195 of the Washington Administrative Code (WAC). Therefore, the following provides a brief overview of my experience and credentials to conduct the detailed evaluations on the subject property. I am the Founder, Owner, and Principal Wetland and Wildlife Ecologist of Wetlands & Wildlife, Inc. I attended the University of Montana where I graduated cum laude with a degree in Wildlife Biology. As of 2020, I have 19 years of direct experience as a professional Biologist / Ecologist in western Washington and 23 years of overall experience completing natural resource assessments among many different ecosystems across the western United States. I have worked as a professional Biologist/Ecologist for federal, state, and county environmental agencies, as well as several private environmental consulting firms with specialties in wetlands, streams, rivers, lakes, and wildlife habitat. In my 23 years of experience, I have specialized in review of proposed land use and building development permit applications as they pertain to Critical Areas (wetlands, rivers, streams, lakes, and habitats of protected fish and wildlife species). Much of that experience came as a Senior Reviewing Ecologist for King County DDES and a Regulatory Biologist for Snohomish County PDS.

I am listed on several Preferred / Qualified Consultant Rosters throughout western Washington. I am highly experienced with the required U.S. Army Corps of Engineers and Washington State wetland delineation methods. In addition to the wetland delineation certification, I am trained by the Washington Department of Ecology and have 15 years of experience in the use of the required Wetland Rating Form for western Washington (since its inception). I am trained by the Washington Department of Ecology to determine Ordinary High Water Mark (OHWM) locations for rivers, streams, and lakes. In addition to my expertise

related to wetlands and streams, I have many years of experience conducting surveys of special-status wildlife species in the western U.S. I received certifications from the Washington Department of Fish and Wildlife for terrestrial wildlife habitat assessments and wildlife surveys of special-status wildlife species.

I have conducted over 1,900 biological / ecological assessments in different capacities on properties with many habitat types and zoning designations, from small, urban properties (0.25 acres) to large, rural properties (up to 2,000 acres in size). I have been selected by several local city jurisdictions to provide on-call 3rd-party environmental reviews of proposed development projects for compliance with local Critical Areas Ordinances and the FEMA Floodplain Habitat Assessment and Mitigation document.

PURPOSE OF THIS REPORT AND BRIEF DISCUSSION REGARDING THE PROPOSED PROJECT

This report is intended to be submitted to the City of Mercer Island Permitting Division for the purpose of obtaining confirmation related to the extent, location, and classification of any regulated Critical Areas on the subject property. This report provides information related to any regulated wetlands, streams, and associated buffers that are located on or near the subject property.

The property owner is proposing to construct a 2nd-story addition on the property, entirely located within the bounds of the roofline / overhangs associated with the existing house. Per information obtained from Cindy Larsen, Architect from *Bassett Larsen Design*, *LLC*, the proposed 2nd-story addition would provide approximately 1,000 square feet of additional living space. Please see the attached Map Sheet CA1.00 for a general depiction of the proposed second-story addition in relation to the existing site features.

The proposed 2nd-story addition has been very carefully examined in accordance with the mitigation sequencing requirements outlined in MICC section 19.07.100. Due to the size of the property, location of the existing house, property line setbacks, and / or the site constraints associated with the on-site Critical Areas detailed in this report, there is no opportunity to construct the proposed 2nd-story addition outside of the standard 60-foot buffer width associated with the Type Ns stream located near the southern property line or outside the standard 60-foot buffer associated with Off-site Wetland C.

Per comments received by the project team from the City of Mercer Island staff during the pre-application meeting for this project, buffer averaging is the preferred approach compared to buffer reduction. Therefore, the property owner is proposing buffer averaging in accordance with MICC section 19.07.180.C.4 (buffer averaging related to the standard stream buffer) and MICC section 19.07.190.C.5 (buffer averaging related to the standard wetland buffer of Off-site Wetland C). As depicted on Map Sheet CA1.00, the proposed buffer averaging (reduction) will occur ONLY among the existing house footprint where no ecological functions are currently provided due to the existing house being in that location. The total proposed buffer averaging (reduction) area equals approximately 425 square feet. However, please note again that the proposed buffer averaging (reduction) area is located entirely on top of the existing house (entirely within the existing house footprint). The proposed 2nd-story addition would not result in any increase in impervious surfaces and would not adversely impact any of the primary ecological functions provided by streams and wetlands (water quality, hydrologic control, or wildlife habitat). The proposed buffer averaging (addition) area is located among the western portion of the property primarily among

existing forested areas. The proposed buffer averaging (addition) area also equals 425 square feet which is equivalent in area to the proposed buffer averaging (reduction) area. Please view the report section below title Proposed Buffer Averaging Plan for more details.

Based on this information, it is the professional opinion that the proposed project meets the intent and requirements of the MICC. Please view the remainder of this report for more information regarding our findings and determinations.

METHODOLOGIES OF CRITICAL AREAS EVALUATION

Wetlands & Wildlife, Inc. used methodologies described in <u>Determining the Ordinary High Water Mark for Shoreline Management Act Compliance in Washington</u> State and definitions outlined in MICC19.16.010 to make a determination regarding any potential regulated streams, lakes, or rivers on or near the subject property in accordance with the MICC regulations.

Wetlands & Wildlife, Inc. also used the routine methodologies described in the Washington State Wetlands Identification and Delineation Manual (Washington State Department of Ecology Publication #96-94, March 1997) to make a determination regarding the presence of any regulated wetlands. In addition, Wetlands & Wildlife, Inc. evaluated the site using the U.S. Army Corps of Engineers Wetland Delineation Manual produced in 1987 and the U.S. Army Corps of Engineers Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region produced in May 2010 (hereinafter referred to as the "Regional Supplement"). The Regional Supplement is designed for concurrent use with the 1987 Corps Wetland Delineation Manual and all subsequent versions. The Regional Supplement provides technical guidance and procedures for identifying and delineating wetlands that may be subject to regulatory jurisdiction under Section 404 of the Clean Water Act. Where differences in the two documents occur, this Regional Supplement takes precedence over the Corps Manual for applications in the Western Mountains, Valleys, and Coast Region.

According to the federal and state methodologies described above, identification of wetlands is based on a three-factor approach involving indicators of hydrophytic vegetation, hydric soils, and presence or evidence of persistent hydrology. Except where noted in the manuals, the three-factor approach discussed above requires positive indicators of hydrophytic vegetation, hydric soils, and wetland hydrology to make a determination that an area is a regulated wetland. Using the aforementioned manuals, the site characteristics for making a wetland determination include the following:

- 1.) Examination of the site for hydrophytic vegetation (species present/percent cover);
- 2.) Examination for the presence of hydric soils in areas where hydrophytic vegetation is present; and
- 3.) Examination to determine if adequate hydrology exists for sufficient durations during the early part of the growing season in the same locations as the previous two steps.

Per City of Mercer Island requirements, *Wetlands & Wildlife, Inc.* examined the entire subject site and rated wetlands using the Washington State Wetland Rating System for Western Washington (Revised, Publication No. 14-06-029, October 2014). In addition to assessing the site characteristics on the subject

property, Wetlands & Wildlife, Inc. also visually assessed the surrounding properties within approximately 300 feet of the subject property to the maximum extent practical without accessing adjacent private properties due to a lack of legal site access onto those other private properties. While a detailed assessment of Critical Areas on adjacent private properties was not possible due to lack of legal access, Wetlands & Wildlife, Inc. conducted a review of all readily available information to assess the potential presence of any off-site Critical Areas in close proximity to the subject site. The evaluation of adjacent properties is necessary to determine if any regulated Critical Areas exist off-site which would cause associated protective buffers to extend onto the property and potentially affect a future development proposal on the subject property.

In addition to on-site field evaluations, we also examined the Web Soil Survey maps produced by the Natural Resources Conservation Service (NRCS), National Wetlands Inventory (NWI) maps produced by the U.S. Fish and Wildlife Service (USFWS), SalmonScape fish distribution maps produced by the Washington Department of Fish and Wildlife (WDFW), and StreamNet fish distribution maps produced by Pacific States Marine Fisheries Commission.

RESULTS AND FINDINGS OF CRITICAL AREAS EVALUATION

Based on our detailed evaluations of the subject property, one stream (Stream A) is located on-site among the southwest corner of the subject property and the stream is located in close proximity to the southern property boundary. In addition to the stream, three separate regulated wetlands are located off-site to the south of the property. Please view the attached Map Sheet CA1.00 for the location of the Critical Areas described above. No other regulated wetlands or streams were located on or near the subject site that would affect the proposed development

Cowardin Classifications:

According to the Cowardin System, as described in Classification of Wetlands and Deepwater Habitats of the United States, the classifications for the subject stream and wetlands follow:

Stream A: Riverine, Intermittent, Streambed, Cobble-Gravel (R4SB3)

Off-site Wetland A: Palustrine, Emergent, Persistent, Saturated (PEM1B)

Off-site Wetland B: Palustrine, Forested, Broad-Leaved Evergreen, Saturated (PFO3B)

Off-site Wetland C: Palustrine, Emergent, Persistent, Saturated (PEM1B)

Classifications Pursuant to the City of Mercer Island Critical Areas Regulations:

Pursuant to Chapter 19.07 of the MICC, the classifications and regulations related to the stream and off-site wetlands are described below.

Stream A transports hydrology generally from west to east. This stream is located on-site among the southwestern portion of the property, and then extends off-site but is located in close proximity to the southern property line as shown on Map Sheet CA1.00. Stream A is classified on the City of Mercer Island GIS Portal as a non-fish bearing stream and appears to be a seasonal / intermittent stream. Therefore, the stream is considered a Type Ns stream. Per MICC section 19.07.180.C.1, Type Ns

streams in the City of Mercer Island typically receive 60-foot protective buffers. Therefore, the standard buffer width required for this stream on this site equals 60 feet. Please see the discussion below regarding overlapping buffer widths and see the attached Map Sheet CA1.00 for a depiction of Stream A. Please also view the report section below titled Proposed Buffer Averaging Plan.

Off-site Wetland A is located off-site to the south of the property, near the southwest property corner as depicted on the attached Map Sheet CA1.00. Per the City of Mercer Island code requirements, Wetland A was rated using the Washington State Wetland Rating System for Western Washington (Revised, Publication No. 14-06-029, October 2014). The wetland slopes from south to north toward Stream A and was therefore rated as a "Slope" wetland on the Wetland Rating Form. Using the Wetland Rating Form, the subject wetland scored a total of 14 points (6 points for Water Quality Functions, 4 points for Hydrologic Functions, and 4 points for Habitat Functions) and is therefore considered a Category IV wetland. The rating form is attached to this report for viewing. Per the table shown MICC 19.07.090.C.1, Category IV wetlands typically require a protective buffer width of 40 feet to be applied parallel to the wetland boundary. Therefore, the standard buffer width required for Wetland A equals 40 feet. Please view the discussion below regarding overlapping buffer widths and the attached Map Sheet CA1.00 for a depiction of Wetland A and its associated protective buffer.

Off-site Wetland B is located off-site to the south of the property, south of the existing residence as depicted on the attached Map Sheet CA1.00. Per the City of Mercer Island code requirements, Wetland B was rated using the Washington State Wetland Rating System for Western Washington (Revised, Publication No. 14-06-029, October 2014). The wetland slopes from toward Stream A and was therefore rated as a "Slope" wetland on the Wetland Rating Form. Using the Wetland Rating Form, the subject wetland scored a total of 13 points (6 points for Water Quality Functions, 3 points for Hydrologic Functions, and 4 points for Habitat Functions) and is therefore considered a Category IV wetland. The rating form is attached to this report for viewing. Per the table shown MICC 19.07.090.C.1, Category IV wetlands typically require a protective buffer width of 40 feet to be applied parallel to the wetland boundary. Therefore, the standard buffer width required for Wetland B equals 40 feet. Please view the discussion below regarding overlapping buffer widths and the attached Map Sheet CA1.00 for a depiction of Wetland B and its associated protective buffer.

Off-site Wetland C is located just off-site to the south of the property, south of the existing concrete driveway and near the existing asphalt road as depicted on the attached Map Sheet CA1.00. Per the City of Mercer Island code requirements, Wetland C was rated using the Washington State Wetland Rating System for Western Washington (Revised, Publication No. 14-06-029, October 2014). The wetland slopes from north to south toward Stream A and was therefore rated as a "Slope" wetland on the Wetland Rating Form .Using the Wetland Rating Form, the subject wetland scored a total of 16 points (7 points for Water Quality Functions, 4 points for Hydrologic Functions, and 5 points for Habitat Functions) and is therefore considered a Category III wetland. The rating form is attached to this report for viewing. Per the table shown MICC 19.07.080(C)(1), Category III wetlands which receive 5 points on the habitat section of the Wetland Rating Form typically require a protective buffer width of 60 feet to be applied parallel to the wetland boundary. Therefore, the standard buffer width required for Wetland C equals 60 feet. Please view the discussion below regarding overlapping buffer widths and the attached Map Sheet CA1.00

for a depiction of Wetland C and its associated protective buffer. Please also view the report section below titled Proposed Buffer Averaging Plan.

<u>Discussion Regarding Geologic Hazard Assessment:</u>

Wetlands & Wildlife, Inc. does not conduct geologic hazard assessments to determine if project sites contain any regulated geologic hazard areas. However, the property owners retained Associated Earth Sciences, Inc. to evaluate the property for potential geologic hazard areas on the subject property in accordance with the City of Mercer Island's code requirements. Please view the letter dated January 22, 2021 which was prepared by Timothy Peter, Senior Engineering Geologist of Associated Earth Sciences, Inc., the southwestern portion of the subject property contains a regulated steep slope / landslide hazard area per the definitions in the City of Mercer Island's code. Based on the conditions present, Associated Earth Sciences, Inc. recommends a 25-foot buffer from the steep slope / landslide hazard area. Please view Map Sheet CA1.00 which depicts the steep slope / landslide hazard area and the recommended 25-foot buffer associated with the slope. Please also see the discussion below regarding overlapping buffers.

<u>Discussion Regarding Overlapping Critical Areas Buffers:</u>

As mentioned above, the subject property contains multiple Critical Areas which are regulated pursuant to Chapter 19.07 of the MICC. When two or more Critical Area buffers overlap, the more restrictive buffer typically applies. On these particular properties, the resulting standard buffer line from overlapping buffer widths is shown on the attached Map Sheet CA1.00. The proposed buffer averaging (addition) area is located outside of the standard overriding buffer lines.

Discussion Regarding Building Setback Line:

In addition to the protective buffer widths described above, MICC section 19.07.180.C.7 states "...buildings and other structures shall be set back a minimum of ten feet from the edges of a watercourse buffer." However, per correspondence between Robin Proebsting (Senior Planner at the City of Mercer Island's Community Planning and Development Department) and Cindy Larsen of *Bassett Larsen Design*, *LLC*, the proposed 2nd-story addition will not be required to be located 10 feet from the proposed reduced buffer line since the proposed reduced buffer line lands on the existing residence as depicted on Map Sheet CA1.00.

On-site Vegetation and Soils Data:

Wetlands & Wildlife, Inc. collected detailed vegetation and soils data at six (6) different locations to gain representative data regarding vegetative characteristics. Wetlands & Wildlife, Inc. did not have legal access to assess soils or hydrology for the off-site wetland data points because the wetlands are located off-site to the south of the property on an adjacent privately-owned property. However, per professional ecological standards and requirements, visual assessments were conducted while standing on the southern property line to determine that the required wetland parameters are likely met among the off-site wetlands. Please view the six Wetland Determination Data Forms (produced by the Army Corps of Engineers) which describe the determinations at each data point location. The data forms are attached to this report, and are labeled as DP1 through DP6. Please also view the location of these data points (labeled as DP) shown on the attached Map Sheet CA1.00.

Natural Resource Conservation Service Soils Description:

The Natural Resources Conservation Service (NRCS) mapped the soil on the entire subject property as Kitsap Silt Loam (15 to 30 percent slopes). Kitsap Silt Loam (15 to 30 percent slopes) is typically formed on Terraces with a parent material of Lacustrine deposits with minor amount of volcanic ash. The depth to restrictive feature is typically more than 80 inches below the soil surface. This soil type is moderately well drained and the frequency of flooding and ponding is none. Available water capacity is high. The typical soil profile is ashy silt loam from 0 to 40 inches below the surface and stratified silt to silty clay loam from 40 to 60 inches below the surface. Minor components include Bellingham soil series (1 percent), Seattle soil series (1 percent) and Tukwila soil series (1 percent).

EXISTING ECOLOGICAL FUNCTIONS AND VALUES ASSESSMENT

The methodologies for this functions and values analysis are based on professional opinion developed through past field analyses and interpretations. This analysis pertains specifically to the subject wetlands, stream and buffer characteristics, but is typical for assessments of similar systems throughout the Puget Sound region of western Washington.

The three main functions provided by wetlands include water quality, stormwater / hydrologic control, and wildlife habitat. These functions become increasingly important in an urbanizing environment. The subject wetlands are dominated by shrub and emergent vegetation. Established vegetation serves to intercept rainfall before it strikes the soil, thereby preventing erosion and improving water quality. In addition, a dense herbaceous layer provides greater resistance to surface water flow, thereby allowing more time for pollutants to settle out. The vegetation and adsorbent soils serve to trap sediment and pollutants and provide increased water quality functions to aid in a reduction of suspended sediment in surface water flows which results in cleaner water leaving the site. Among areas of steep gradient topography, the function of these characteristics is particularly important to decrease the water velocity of the associated down-gradient systems, which can reduce peak flood stages during heavy rainfall and increase water retention during dry periods. Water retained within the wetlands slowly infiltrates into the ground, thus recharging groundwater and helping to moderate groundwater levels and reduce down-gradient flows.

Wetlands often contain necessary habitat components such as hiding cover, thermal cover, water, and forage opportunities in close proximity. As evidenced by the scores of 4 and 5 for Habitat Functions on the attached Wetland Rating Forms, each of the subject wetlands provides a low level of habitat for wildlife species. The subject wetlands evaluated for this proposed project contain limited vegetation classes and water regimes and contain few special habitat features except for undercut banks, which provide limited functional habitat for wildlife because of the isolated characteristic and sizes of the off-site wetlands. The surrounding landscape also provides a low level of opportunity to support the potential for wildlife habitat based on the proximity to undisturbed habitat and disturbed areas such as residential land use and roadways that support daily human traffic. The overall level of habitat functions in the project vicinity are significantly reduced due to the residential land-use and proximity to roadways that support daily human traffic.

Although the Type Ns stream located on and near the property does not provide habitat for fish species, the

stream provides other important ecological functions to the surrounding environment such as hydrological transport, and transport of solids (suspended and dissolved), among other functions. The portions of the site adjacent to the stream (vegetated wetland and associated upland buffers, etc.) are increasingly important to manage appropriately as these areas aid in water quality and hydrologic control, resulting in cleaner water entering the stream's channel. The adjacent wetlands have limited established vegetation among this riparian corridor and therefore provide diminished habitat for wildlife species. However, any overhanging vegetation present among the riparian corridor aids in the potential future recruitment of large woody debris and organic matter to the stream channel.

As areas become further populated with humans and many habitat areas become fragmented, the protected habitat provided by wetlands and associated buffers become increasingly important.

PROPOSED BUFFER AVERAGING PLAN

The proposed 2nd-story addition has been very carefully evaluated and designed in accordance with the mitigation sequencing requirements outlined in MICC section 19.07.100 which states that "an applicant for a development proposal or activity shall implement the following sequential measures, listed below in order of preference, to avoid, minimize, and mitigate impacts to environmentally critical areas and associated buffers". Due to the size of the property, location of the existing house, property line setbacks, and / or the site constraints associated with the on-site Critical Areas detailed in this report, there is no opportunity to construct the 2nd-story addition outside of the standard 60-foot buffer widths associated with the Type Ns stream and Off-site Wetland C.

Per comments received by the project team from the City of Mercer Island staff during the pre-application meeting for this project, buffer averaging is the preferred approach compared to buffer reduction. Therefore, the property owner is proposing buffer averaging in accordance with all required criteria listed in MICC section 19.07.180.C.4 (buffer averaging related to the standard stream buffer) and MICC section 19.07.190.C.5 (buffer averaging related to the standard wetland buffer of Off-site Wetland C). As depicted on Map Sheet CA1.00, the proposed buffer averaging (reduction) will occur ONLY among the existing house footprint where no ecological functions are currently provided due to the existing house being in that location. The proposed buffer averaging depicted on the attached Map Sheet CA1.00 will reduce the standard stream buffer to a minimum of 46.7 feet (77.8% of the standard buffer remaining) and will reduce the standard wetland buffer associated with Off-site Wetland C to a minimum of 51.1 feet (85.2% of the standard wetland buffer remaining). The total proposed buffer averaging (reduction) area equals approximately 425 square feet. However, please note again that the proposed buffer averaging (reduction) area is located entirely on top of the existing house (entirely within the existing house footprint). The proposed 2nd-story addition would not result in any increase in impervious surfaces and would not adversely impact any of the primary ecological functions provided by streams and wetlands (water quality, hydrologic control, or wildlife habitat).

The proposed buffer averaging (addition) area is located among the western portion of the property primarily among existing forested areas. As depicted on Map Sheet CA1.00, the buffer averaging (addition) area is located outside of all other Critical Areas, associated standard buffers, and the existing road easement (in case of a future need to widen or improve the existing private road). The proposed buffer averaging (addition) areas provide a significantly higher level of ecological functions when compared to the proposed buffer averaging (reduction) areas, due to the native forested vegetation among the majority of the buffer averaging (addition) areas compared to the existing house footprint in the buffer averaging (reduction) areas.

PROJECT'S IMPACT DETERMINATIONS RELATED TO CRITICAL AREAS

As previously described in this report, the proposed 2nd-story addition will not result in any increase in impervious surfaces and will not adversely impact any of the primary ecological functions provided by streams and wetlands (water quality, hydrologic control, or wildlife habitat as discussed above in this report). The proposed buffer averaging plan described in this report has been specifically prepared in accordance with all required criteria outlined in MICC section 19.07.180.C.4 and MICC section 19.07.190.C.5. Further, the proposed buffer averaging (addition) areas provide a significantly higher level of ecological functions when compared to the proposed buffer averaging (reduction) areas, due to the native forested vegetation among the majority of the buffer averaging (addition) areas compared to the existing house footprint located among the buffer averaging (reduction) areas.

Based on this information, it is the professional opinion that the proposed project meets the intent and all code requirements outlined in Chapter 19.07 of the Mercer Island City Code. Per the City of Mercer Island code requirements and professional ecological industry standards, the proposed buffer averaging (addition) areas would be regulated as buffer in perpetuity, thereby providing protected additional native vegetation areas on the subject property even though no vegetation would be impacted and no new impervious surfaces would result from the proposed 2nd-story addition. Therefore, no additional compensatory mitigation efforts beyond the proposed buffer averaging plan are proposed or required for this project, since no adverse ecological impacts will result from the project proposal to add a 2nd-story addition entirely within the limits of the footprint of the existing single-family residence / existing impervious surface.

LIMITATIONS AND USE OF THIS REPORT

This Critical Areas Study is supplied to *Westhill, Inc.* as a means of determining whether any wetlands, streams, and / or wildlife habitat conservation areas regulated by City of Mercer Island Critical Areas Regulations exist on the site or within close proximity of the site which would affect the permit requirements of the proposed development on the site. This report is intended to provide information deemed relevant in the applicant's attempt to comply with the regulations currently in effect.

The work for this report has conformed to the standard of care employed by professional ecologists in the Puget Sound region. No other representation or warranty, expressed or implied, is made concerning the work or this report. This report is based largely on readily observable conditions and, to a lesser extent, on readily ascertainable conditions. No attempt has been made to determine hidden or concealed conditions. If hidden or concealed conditions arise, the information contained in this report may change based upon those conditions.

The laws applicable to Critical Areas are subject to varying interpretations. While *Wetlands & Wildlife, Inc.* upheld professional industry standards when completing this review, the information included in this report does not guarantee approval by any federal, state, and/or local permitting agencies. Therefore, the work associated with this proposal shall not commence until permits have been obtained from all applicable agencies.

If any questions arise, please contact me directly at (425) 337-6450.

Maps and figures required to answer questions correctly for Western Washington

Depressional Wetlands

| Map of: | To answer questions: | Figure # |
|--|----------------------|----------|
| Cowardin plant classes | D 1.3, H 1.1, H 1.4 | |
| Hydroperiods | D 1.4, H 1.2 | |
| Location of outlet (can be added to map of hydroperiods) | D 1.1, D 4.1 | |
| Boundary of area within 150 ft of the wetland (can be added to another figure) | D 2.2, D 5.2 | |
| Map of the contributing basin | D 4.3, D 5.3 | |
| 1 km Polygon: Area that extends 1 km from entire wetland edge - including | H 2.1, H 2.2, H 2.3 | |
| polygons for accessible habitat and undisturbed habitat | | |
| Screen capture of map of 303(d) listed waters in basin (from Ecology website) | D 3.1, D 3.2 | |
| Screen capture of list of TMDLs for WRIA in which unit is found (from web) | D 3.3 | |

Riverine Wetlands

| Map of: | To answer questions: | Figure # |
|--|----------------------|----------|
| Cowardin plant classes | H 1.1, H 1.4 | |
| Hydroperiods | H 1.2 | |
| Ponded depressions | R 1.1 | |
| Boundary of area within 150 ft of the wetland (can be added to another figure) | R 2.4 | |
| Plant cover of trees, shrubs, and herbaceous plants | R 1.2, R 4.2 | |
| Width of unit vs. width of stream (can be added to another figure) | R 4.1 | |
| Map of the contributing basin | R 2.2, R 2.3, R 5.2 | |
| 1 km Polygon: Area that extends 1 km from entire wetland edge - including | H 2.1, H 2.2, H 2.3 | |
| polygons for accessible habitat and undisturbed habitat | | |
| Screen capture of map of 303(d) listed waters in basin (from Ecology website) | R 3.1 | |
| Screen capture of list of TMDLs for WRIA in which unit is found (from web) | R 3.2, R 3.3 | |

Lake Fringe Wetlands

| Map of: | To answer questions: | Figure # |
|---|----------------------------|----------|
| Cowardin plant classes | L 1.1, L 4.1, H 1.1, H 1.4 | |
| Plant cover of trees, shrubs, and herbaceous plants | L 1.2 | |
| Boundary of area within 150 ft of the wetland (can be added to another figure) | L 2.2 | |
| 1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat | H 2.1, H 2.2, H 2.3 | |
| Screen capture of map of 303(d) listed waters in basin (from Ecology website) | L 3.1, L 3.2 | |
| Screen capture of list of TMDLs for WRIA in which unit is found (from web) | L 3.3 | |

Slope Wetlands

| Map of: | To answer questions: | Figure # |
|---|----------------------|----------|
| Cowardin plant classes | H 1.1, H 1.4 | 1 |
| Hydroperiods | H 1.2 | 2 |
| Plant cover of dense trees, shrubs, and herbaceous plants | S 1.3 | 3 |
| Plant cover of dense , rigid trees, shrubs, and herbaceous plants | S 4.1 | 3 |
| (can be added to figure above) | | |
| Boundary of 150 ft buffer (can be added to another figure) | S 2.1, S 5.1 | 1 |
| 1 km Polygon: Area that extends 1 km from entire wetland edge - including | H 2.1, H 2.2, H 2.3 | 4 |
| polygons for accessible habitat and undisturbed habitat | | 4 |

| Screen capture of list of TMDLs for WRIA in which unit is found (from web) | S 3.3 | 6 |

| SLOPE WETLANDS | |
|--|----------------|
| Water Quality Functions - Indicators that the site functions to improve water quality | |
| S 1.0. Does the site have the potential to improve water quality? | |
| S 1.1. Characteristics of the average slope of the wetland: (a 1% slope has a 1 ft vertical drop in elevation for every 100 ft of horizontal distance) Slope is 1% or less points = 3 Slope is > 1%-2% Slope is > 2%-5% points = 1 | 1 |
| Slope is greater than 5% points = 0 | |
| S 1.2. The soil 2 in below the surface (or duff layer) is true clay or true organic (use NRCS definitions): Yes = 3 No = 0 | 0 |
| S 1.3. Characteristics of the plants in the wetland that trap sediments and pollutants: Choose the points appropriate for the description that best fits the plants in the wetland. Dense means you have trouble seeing the soil surface (>75% cover), and uncut means not grazed or mowed and plants are higher than 6 in. Dense, uncut, herbaceous plants > 90% of the wetland area Posse, uncut, borbaceous plants > 1/ of area. | 1 |
| Dense, uncut, herbaceous plants > ½ of area points = 3 Dense, woody, plants > ½ of area points = 2 Dense, uncut, herbaceous plants > ¼ of area points = 1 Does not meet any of the criteria above for plants points = 0 | |
| Total for S 1 Add the points in the boxes above | 2 |
| Rating of Site Potential If score is: $12 = H$ 6-11 = M $\sqrt{0-5} = L$ Record the rating on | the first page |

| 1 |
|---|

| 0 |
| • |
| 1 |
| |

S 3.0. Is the water quality improvement provided by the site valuable to society? S 3.1. Does the wetland discharge directly (i.e., within 1 mi) to a stream, river, lake, or marine water that is on the 0 303(d) list? Yes = 1 No = 0S 3.2. Is the wetland in a basin or sub-basin where water quality is an issue? At least one aquatic resource in the basin is 1 on the 303(d) list. Yes = 1 No = 0S 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? Answer YES 2 if there is a TMDL for the basin in which unit is found. Yes = 2 No = 0Total for S 3 Add the points in the boxes above 3

Rating of Value If score is: ____2-4 = H ____1 = M ____0 = L

Rating of Landscape Potential If score is: 1-2 = M ___0 = L

Record the rating on the first page

Record the rating on the first page

| SLOPE WETLANDS | |
|--|----------------|
| Hydrologic Functions - Indicators that the site functions to reduce flooding and stream eros | sion |
| S 4.0. Does the site have the potential to reduce flooding and stream erosion? | |
| S 4.1. Characteristics of plants that reduce the velocity of surface flows during storms: Choose the points appropriate for the description that best fits conditions in the wetland. Stems of plants should be thick enough (usually > 1/8 in), or dense enough, to remain erect during surface flows. Dense, uncut, rigid plants cover > 90% of the area of the wetland All other conditions points = 0 | 0 |
| Rating of Site Potential If score is:1 = M0 = L | the first page |
| S 5.0. Does the landscape have the potential to support the hydrologic functions of the site? | |
| S 5.1. Is more than 25% of the area within 150 ft upslope of wetland in land uses or cover that generate excess surface runoff? Yes = 1 No = 0 | 1 |
| Rating of Landscape Potential If score is: 1 = M0 = L Record the rating on | the first page |
| S 6.0. Are the hydrologic functions provided by the site valuable to society? | |
| S 6.1. Distance to the nearest areas downstream that have flooding problems: The sub-basin immediately down-gradient of site has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds) points = 2 | 0 |

S 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?

Rating of Value If score is: 2-4 = H 1 = M 0 = L

No flooding problems anywhere downstream

NOTES and FIELD OBSERVATIONS:

Total for S 6

These questions apply to wetlands of all HGM classes. **HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat H 1.0. Does the site have the potential to provide habitat? H 1.1. Structure of plant community: Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked. Aquatic bed 4 structures or more: points = 4 **V** Emergent 3 structures: points = 2 0 Scrub-shrub (areas where shrubs have > 30% cover) 2 structures: points = 1 Forested (areas where trees have > 30% cover) 1 structure: points = 0 If the unit has a Forested class, check if: The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon H 1.2. Hydroperiods Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (see text for descriptions of hydroperiods). Permanently flooded or inundated 4 or more types present: points = 3 Seasonally flooded or inundated 3 types present: points = 2 Occasionally flooded or inundated 2 types present: points = 1 1 **▼** Saturated only 1 type present: points = 0 Permanently flowing stream or river in, or adjacent to, the wetland Seasonally flowing stream in, or adjacent to, the wetland Lake Fringe wetland 2 points Freshwater tidal wetland 2 points H 1.3. Richness of plant species Count the number of plant species in the wetland that cover at least 10 ft². Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle If you counted: > 19 species points = 2 5 - 19 species points = 1 < 5 species points = 0 H 1.4. Interspersion of habitats Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. If you have four or more plant classes or three classes and open water, the rating is always high. None = 0 points Moderate = 2 points Low = 1 point All three diagrams in this row are **HIGH** = 3points

| | | 1 |
|--|--|---------------|
| H 1.5. Special habitat features: Check the habitat features that are present in the wetland. The numberLarge, downed, woody debris within the wetland (> 4 in diameterStanding snags (dbh > 4 in) within the wetland Undercut banks are present for at least 6.6 ft (2 m) and/or overhad over a stream (or ditch) in, or contiguous with the wetland, for atStable steep banks of fine material that might be used by beaver of slope) OR signs of recent beaver activity are present (cut shrubs of where wood is exposed) At least ¼ ac of thin-stemmed persistent plants or woody branched permanently or seasonally inundated (structures for egg-laying be strata) Total for H 1 | and 6 ft long). Inging plants extends at least 3.3 ft (1 m) I least 33 ft (10 m) I least 33 ft (1 m) I least 33 ft (10 m) I least 34 ft (10 m) I least 35 ft (10 m) I le | 2 |

| Rating of Landscape Potential If score is:4-6 = H1-3 = M<1 = H 3.0. Is the habitat provided by the site valuable to society? | | e first page |
| H 3.1. Does the site provide habitat for species valued in laws, regulations, or that applies to the wetland being rated. Site meets ANY of the following criteria: — It has 3 or more priority habitats within 100 m (see next page) — It provides habitat for Threatened or Endangered species (any plar) — It is mapped as a location for an individual WDFW priority species — It is a Wetland of High Conservation Value as determined by the D — It has been categorized as an important habitat site in a local or re Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) within 100 m Site does not meet any of the criteria above Rating of Value If score is:2 = H1 = M0 = L | points = 2 nt or animal on the state or federal lists) epartment of Natural Resources | 1 |

Wetland Rating System for Western WA: 2014 Update Rating Form – Effective January 1, 2015

WDFW Priority Habitats

<u>Priority habitats listed by WDFW</u> (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: *NOTE:* This question is independent of the land use between the wetland unit and the priority habitat.

- **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- Old-growth/Mature forests: Old-growth west of Cascade crest Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 see web link above*).
- **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 see web link above*).
- Instream: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report see web link on previous page*).
- **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 6.5 ft (0.15 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- Snags and Logs: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

NOTES and FIELD OBSERVATIONS:

Total for S 6

These questions apply to wetlands of all HGM classes. **HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat H 1.0. Does the site have the potential to provide habitat? H 1.1. Structure of plant community: Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked. Aquatic bed 4 structures or more: points = 4 3 structures: points = 2 Emergent 1 _Scrub-shrub (areas where shrubs have > 30% cover) 2 structures: points = 1 ▼ Forested (areas where trees have > 30% cover) 1 structure: points = 0 If the unit has a Forested class, check if: The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon H 1.2. Hydroperiods Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (see text for descriptions of hydroperiods). Permanently flooded or inundated 4 or more types present: points = 3 Seasonally flooded or inundated 3 types present: points = 2 Occasionally flooded or inundated 2 types present: points = 1 1 Saturated only 1 type present: points = 0 Permanently flowing stream or river in, or adjacent to, the wetland Seasonally flowing stream in, or adjacent to, the wetland Lake Fringe wetland 2 points Freshwater tidal wetland 2 points H 1.3. Richness of plant species Count the number of plant species in the wetland that cover at least 10 ft². Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle If you counted: > 19 species points = 2 5 - 19 species points = 1 points = 0 < 5 species H 1.4. Interspersion of habitats Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. If you have four or more plant classes or three classes and open water, the rating is always high. None = 0 points Moderate = 2 points Low = 1 point All three diagrams in this row are **HIGH** = 3points

| H 1.5. Special habitat features: | |
|---|------------------------|
| Check the habitat features that are present in the wetland. The number of checks is the number of points. | |
| Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long). | |
| Standing snags (dbh > 4 in) within the wetland | |
| Undercut banks are present for at least 6.6 ft (2 m) and/or overhanging plants extends at least 3.3 ft | (1 m) |
| over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) | |
| Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degre | e 2 |
| slope) OR signs of recent beaver activity are present (cut shrubs or trees that have not yet weathere | d |
| where wood is exposed) | |
| At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are | |
| permanently or seasonally inundated (structures for egg-laying by amphibians) | |
| Invasive plants cover less than 25% of the wetland area in every stratum of plants (see H 1.1 for list o | f |
| strata) | |
| Total for H 1 Add the points in the boxes al | |
| Rating of Site Potential If score is:15-18 = H7-14 = M0-6 = L Record the ra | ting on the first page |
| H 2.0. Does the landscape have the potential to support the habitat functions of the site? | |
| H 2.1. Accessible habitat (include only habitat that directly abuts wetland unit). | |
| Calculate: % undisturbed habitat $\frac{0}{100}$ + [(% moderate and low intensity land uses)/2] $\frac{0}{100}$ = $\frac{0}{100}$ | % |
| If total accessible habitat is: | |
| $>$ $^{1}/_{3}$ (33.3%) of 1 km Polygon point | s = 3 0 |
| 20-33% of 1 km Polygon point | |
| 10-19% of 1 km Polygon point | |
| < 10% of 1 km Polygon point | |
| H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. | |
| Calculate: % undisturbed habitat $\frac{0}{0}$ + [(% moderate and low intensity land uses)/2]0.75= $\frac{0.75}{0.75}$ | 5 % |
| Undisturbed habitat > 50% of Polygon point | |
| Undisturbed habitat 10-50% and in 1-3 patches point | • |
| Undisturbed habitat 10-50% and > 3 patches point | |
| Undisturbed habitat < 10% of 1 km Polygon point | |
| | 5 - 0 |
| H 2.3. Land use intensity in 1 km Polygon: If | (2) |
| > 50% of 1 km Polygon is high intensity land use points = | |
| ≤ 50% of 1 km Polygon is high intensity point | _ |

Wetland Rating System for Western WA: 2014 Update Rating Form – Effective January 1, 2015

WDFW Priority Habitats

<u>Priority habitats listed by WDFW</u> (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: *NOTE:* This question is independent of the land use between the wetland unit and the priority habitat.

- **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- Old-growth/Mature forests: Old-growth west of Cascade crest Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 see web link above*).

- **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 see web link above*).
- **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report see web link on previous page*).
- **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 6.5 ft (0.15 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

Snags and Logs: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

NOTES and FIELD OBSERVATIONS:

These questions apply to wetlands of all HGM classes. **HABITAT FUNCTIONS** - Indicators that site functions to provide important habitat H 1.0. Does the site have the potential to provide habitat? H 1.1. Structure of plant community: Indicators are Cowardin classes and strata within the Forested class. Check the Cowardin plant classes in the wetland. Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked. Aquatic bed 4 structures or more: points = 4 **▼** Emergent 3 structures: points = 2 0 ___Scrub-shrub (areas where shrubs have > 30% cover) 2 structures: points = 1 Forested (areas where trees have > 30% cover) 1 structure: points = 0 If the unit has a Forested class, check if: The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon H 1.2. Hydroperiods Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (see text for descriptions of hydroperiods). Permanently flooded or inundated 4 or more types present: points = 3 Seasonally flooded or inundated 3 types present: points = 2 Occasionally flooded or inundated 2 types present: points = 1 1 ▼ Saturated only 1 type present: points = 0 Permanently flowing stream or river in, or adjacent to, the wetland Seasonally flowing stream in, or adjacent to, the wetland Lake Fringe wetland 2 points Freshwater tidal wetland 2 points H 1.3. Richness of plant species Count the number of plant species in the wetland that cover at least 10 ft². Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle If you counted: > 19 species points = 2 5 - 19 species points = 1 < 5 species points = 0 H 1.4. Interspersion of habitats Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. If you have four or more plant classes or three classes and open water, the rating is always high. None = 0 points Moderate = 2 points Low = 1 point All three diagrams in this row are **HIGH** = 3points

| 11.1 E. Craccial habitat factures | | |

Wetland Rating System for Western WA: 2014 Update Rating Form – Effective January 1, 2015

WDFW Priority Habitats

<u>Priority habitats listed by WDFW</u> (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: *NOTE:* This question is independent of the land use between the wetland unit and the priority habitat.

- **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).
- **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).
- **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.
- Old-growth/Mature forests: Old-growth west of Cascade crest Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.
- **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 see web link above*).
- **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.
- **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 see web link above*).
- Instream: The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.
- **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report see web link on previous page*).
- **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.
- **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.
- **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 6.5 ft (0.15 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.
- Snags and Logs: Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.
