February 6, 2024

John Keeney
ISA Municipal Specialist, ISA Certified Arborist, TRAQ
City of Mercer Island Arborist

Wes Giesbrecht Atlin Investments, Inc. Mercer Island, WA 98040

Site: 7414 78th Ave SE

Mercer Island, WA 980404

TPN: 2524049075

Area: 68,825 sq. ft. = 1.6 acre

Re: RFI dated November 27th, 2023, changes itemized below, on the report and on the city response matrix highlighted in yellow.

## Comments on Trees:

- 1. The tree protection shown on the site plan is right on the building pad, which would be unrealistic in the field. The building pads will need at least five feet of clearance for walking and machine access. The tree protection and limits of allowable disturbance will need to be adjusted to account for the five-foot clearance. (Building pads were reduced to allow for a 5' buffer, completed by Navix; site play is copied and pasted onto page 21)
- 2. Please provide a separate Tree Inventory and Replacement Submittal Information form. This form will confirm what was listed as removed in the arborist report matches what is shown or removal on the plans. The form would also be able to be updated if the plan changes. This should be completed once the viability of all trees has been confirmed. (Completed; a separate Tree Inventory Worksheet has been provided with the submittal and the information has been copied and pasted to the report on pages: 24-26.
- 3. The provided tree inventory worksheet and the table in the arborist report and site plan do not match. Some trees are listed as exceptional in one document, but not the other. The arborist report lists tree 8118 as exceptional, but the tree inventory worksheet does not (corrected). The tree inventory worksheet lists tree 8234 as exceptional, but the arborist report does not (corrected). Based on the arborist report, tree 8325 should be included in the list of trees over 24 inches on the tree inventory worksheet as well. (Corrected) Please revisit the arborist report, site plan, and tree inventory worksheet to ensure that they are consistent with each other. (Corrected) I have revised the MI Tree Inventory to correct mistakes, and I have corrected the arborist table to show tree 8234 as exceptional per code regulating DBH of specific species to be included as exceptional trees. Both Navix and CLS have conferred to ensure that trees representations are consistent.

## In summary:

Tree Density Calculations	
Total number of onsite trees	86
Total number of non-viable trees	39
Total number of viable trees	47
Total number of trees removed for site improvements	27
Total number of required tree credits (30% X 86)	26
Total number of retained tree credits	26
Mitigation:	
Exceptional trees >36" (6: 1) - 2	12
Trees removed from "Exceptional groves" (6:1) -12	72
Exception trees based on size/species (6:1)	6
Large trees 24"-36" (3:1) - 0	0
10"-24" (2:1) - 12	24
Mitigation Total	114

If you have any questions, please contact me. I can be reached on my cell phone: 425.890.3808 or by email:  $\underline{\text{sprince202@aol.com}}$ .

Warm regards,

Susan Prince

Creative Landscape Solutions ISA Certified Arborist #1481 TRAQ Certified Arborist #481 Landscape Designer

425.890.3808

## Personal qualifications, scope of work and methodology:

My examination was limited to a visual one, and did not involve any root excavation, trunk or limb coring, or any soil testing. To evaluate the trees and prepare the report, I drew on my formal college education in botany, preparation and training used to obtain my ISA certification in addition to my certification as a Tree Risk Assessor. I have worked in the field of arboriculture since 1994, have been an ISA Certified Arborist since 1999 and have been TRACE/TRAQ certified since 2009.

I followed protocol delineated by the International Society of Arboriculture (ISA) for Visual Risk Assessment (VRA). By doing so, I am examining each tree independently as well as collectively as groups or stands of trees provide stability and can lower risk of independent tree failure. This scientific process examines tree health (e.g., size, vigor, and insect and disease process) as well as site conditions (soil moisture and composition, quantity of impervious surfaces surrounding the tree etc.)

### Introduction:

Identifying and managing the risks associated with trees is still largely a subjective process. Since the exact nature of tree failures remains largely unknown, our ability as scientists and arborists to predict which trees will fail and in what fashion remains limited. As currently practiced, the science of hazard tree evaluation involves examining a tree for structural defects, including genetic problems, those caused by the local environmental that the tree grows in and those attributed to man (pruning etc.).

The assessment process involves evaluating three components: 1) a tree with the potential to fail, 2) an environment that may contribute to that failure, and 3) a person or object that would be injured or damaged (the target). A defective tree cannot be considered hazardous without the presence of a target. All trees have a finite life-span though it is not pre-programmed internally in the same manner as annual plantings. As trees age, they are less able to compartmentalize structural damage following injury from insects, disease or pruning. Trees in urban settings have a shorter life span than trees grown in an undisturbed habitat.

Each species of trees grows differently. Evergreen trees have a "reputation" of growing slowly and defensively. These trees allocate a high proportion of their resources to defending themselves from pathogens, parasites, and wounds. As a rule, trees with this type of growth tend to be long lived. Though like all other living things, they have a predictable life span. Examples of this type of tree include the northwest *Pseudotsuga menziesii* - Douglas fir, and *Thuja plicata* - Western red cedar.

Deciduous trees are trees that annually shed leaves or needles. These trees tend to grow quickly and try to "outgrow" problems associated with insects, disease, and wounds. They allocate a relatively small portion of their internal resources to defense and rely instead upon an ability to grow more quickly than the pathogens which infect them. However, as these trees age, their growth rate declines, and the normal problems associated with decay begins to catch up and compromise the tree's structural integrity. Examples of this type of tree include *Salix, Populus* and *Alnus*.

Knowledge of the growth and failure patterns of individual tree species is critical to effective hazard analysis. Species vary widely in their rates of failure. The hazard tree evaluation rating system used by most arborists was developed by the Colorado Urban Forest Council and recognizes this variation in species failure and includes a species component as part of the overall hazard evaluation.

### Methods used to determine tree location and tree health:

Trees were identified previously by numbered aluminum tags attached to the western side of the tree. All the trees on site were examined using the Matheny and  $Clark^1$  criteria for determining the potential hazard of trees in an urban environment as well as the Tree Risk Assessment in Urban Areas and The Urban/Rural Interface by Julian Dunster<sup>2</sup>. Tree diameters were measured at DSH (diameter standard height – 4.5' above ground) using a logger's tape. Tree driplines were measured using a PRO Laser Rangefinder<sup>TM</sup> from the edge of the longest branch to the tree trunk.

Because of the native, forested area these trees are growing it, the critical root zone (CRZ) of each tree was taken to be the dripline. The maximum intrusion into the dripline was 50% of the CRZ or the interior critical root zone (iCRZ).

## **Spreadsheet Legend:**

- 1. Tree tag #: Numbered aluminum tags attached to the trees in the field\*1
- 2. Species: The common name of each tree
- 3. Species: Species ID: Spreadsheet contains common names of trees which correspond to scientific names as follows:
  - Apple: Malus sp.
  - American sycamore: Plantanus occidentalis
  - Austrian pine: Pinus nigra
  - Bigleaf maple: Acer macrophyllum
  - Birch: Betula nigra
  - Bitter Cherry: Prunus emarginata
  - Blue atlas cedar: Cedrus atlantica 'Glauca'
  - Cedar: Thuja plicata
  - Cherry: Prunus sp.
  - Dawn redwood: Chamaecyparis nootkatensis
  - Deodora cedar: Cedrus deodara
  - Colorado blue spruce: Picea pungens
  - Cottonwood: Populus trichocarpa
  - Dogwood: Cornus nuttallii
  - Douglas fir: Pseudotsuga menziesii
  - English laurel: Prunus laurocerasus
  - Filbert: Corylus avellana var.
  - Grand fir: Abies grandis
  - Hemlock: Tsuga hetrophylla
  - Holly: *Ilex aquifolium*
  - Japanese maple: Acer palmatum
  - Leylandii cypress: Cupressocyparis leylandii
  - Lodgepole pine: Pinus contorta
  - Mountain ash: Sorbus americana
  - Nobel fir: Abies procera
  - Pear: Pyrus sp.
  - Plum: Prunus
  - Red Alder: Alnus rubra
  - Red maple: Acer rubrum
  - Walnut: Juglans sp.
  - Western red cedar: Thuja plicata
  - Weeping Alaska cedar: Metasequoia glyptostrobides
  - White fir: Abies concolor
  - White pine: Pinus strobus

- 4. DBH: Diameter of the tree measured at 48" above grade
- 5. Adjusted Diameter of the tree: Calculated equivalent for multi-stemmed tree
- 6. Dripline Radius: Measurement in feet of the tree canopy from tree trunk to outermost branch tip
- 7. Windfirm: Whether the tree can withstand wind if surrounding grove is changed
- 8. Health: A measurement of overall tree vigor and vitality rated as excellent, good, and fair or poor based on an assessment of crown density, leaf color and size, active callusing, shoot growth rate, extent of crown dieback, cambium layer health, and tree age
  - Excellent: Tree is an ideal specimen for the species with no obvious flaws
  - Good: Tree has minimal structural or situational defects
  - OK: Tree has minimal structural defects AND minimal environmental concerns
  - Fair: Tree has structural or health issues that predispose it to failure if further stressed, it is not suitable for retention as a single tree but may sometimes be retained if it is retained in a grove
  - Poor: Tree has significant structural and/or health issues. It is exempt from total tree count.
- 9. Defects/Concerns: A measure of the tree's structural stability and failure potential and rated as good, fair or poor based on assessment of specific structural features, e.g., decay, conks, co-dominant trunks, included bark, abnormal lean, one-sided canopy, history of failure, prior construction impact, pruning history, etc.
- 10. Proposed action:
  - Retain
  - Remove due to viability.
  - Remove due to planned development (tree is otherwise healthy)
- 11. Limits of disturbance: The area surrounding the tree that defines the area that surrounds the trunk that cannot be encroached upon during construction. This may be a multiple of the trunk diameter (1 -1.5 times the trunk diameter converted to feet.) or it may be related to the width of the canopy. It is always determined by tree species and environment and is up to the discretion of the ISA Certified Arborist to determine.
- 12. Value: The value the municipality assigns to a tree with the specific DBH, species or location of the assessed tree; notification of size (exceptional etc.)
- 13. Mitigation
  - C. Size All replacement trees shall be at least 6' tall for conifers and at least 1.5" diameter at the base
  - for deciduous trees. Shrubs and bushes are not an acceptable replacement for trees. Smaller replacement trees are allowed if the applicant can demonstrate that smaller trees are more suited to the species, site conditions, neighborhood character, and the purposes of MICC 19.10 and that such replacement trees will be planted in sufficient quantities to meet the intent of MICC 19.10.
  - D. Number of Replacement Trees Removed trees shall have the following base replacement ratio:

Tree Replaceme	ent Ratios
Diameter of Removed Tree	Number of Replacement Trees Required
(measured 4.5' above ground)	
Less than 10 inches	1
10 inches up to 24 inches	2
24 inches up to 36 inches	3
More than 36 inches and any exceptional tree(s)	6

**E.** Maintenance – the applicant must maintain replacement trees in a healthy condition for a period of five years after planting. The applicant shall be obligated to replant any replacement tree that dies, becomes diseased, or is removed during this five-year time period.

**Specific Tree Observations:** Trees that meet the criteria for an exceptional size/species are shown in **bold** and are **highlighted in green**.

## **Aerial View of Site:**

## Proposed site Improvements: (for reference only, see civil plans for details)

## Discussion:

Tree Density Calculations							
Total number of onsite trees							
Total number of non-viable trees	39						
Total number of viable trees	47						
Total number of trees removed for site improvements	27						
Total number of required tree credits (30% X 86)	26						
Total number of retained tree credits	26						
Mitigation:							
Exceptional trees >36" (6: 1) - 2	12						
Trees removed from "Exceptional groves" (6:1) -12	72						
Exception trees based on size/species (6:1)	6						
Large trees 24"-36" (3:1) - 0	0						
10"-24" (2:1) - 12	24						
Mitigation Total	114						

The applicant is requesting to short plat the existing 1.6-acre SFR into four (4) SFR parcels. Currently there is a single-family residence on the parcel accessed by a gravel driveway that wraps around the back of the home to the garage area.

There are eighty-six (86) trees with DBH's 10" or greater on the parcel; thirty-nine (39) are non-viable, forty-seven (47) are viable and suitable for retention.

The trees include eleven (11) trees that are exceptional in DBH: #8118, 8127, 8183, 8233, 8234, 8261, 8277, 8314, 8318, 8325, 8356; three (3) are proposed to be retained (8183, 8314, 8356). Mitigation for 2 removed viable exceptional trees is 6:1 = 12 trees

There is one (1) tree whose species makes its exceptional for its size (8234) proposed to be removed. Mitigation for this tree is 6:1 = 6 trees.

There are several groves on site, twelve (12) trees that are exceptional based on grove status are proposed to be removed; mitigation is 6:1=72 trees.

Lastly, twelve (12) trees, considered to be significant are proposed to be removed; the mitigation for those trees is 2:1 = 24 trees.

Total mitigation for removed trees is (12+6+72+24=) 114 replacement trees.

MICC requires that the applicant retain 30% of the existing trees (30% X 86 = 26). Proposed site improvement retains twenty-six (26) trees for 30%.

Two (2) onsite groves are proposed to be retained; the understory of native shrubs and groundcovers in and around the groves of trees should be retained intact. Any work in the area to remove invasive species (especially holly, ivy, and blackberries) should be completely by hand and 4" of arborist bark (or hog fuel) should be applied around any retained tree that has been impacted by site construction. Additional water should be provided three (3) times per week (approximately 1" of water per week) during periods of drought.

## **EXCEPTIONAL TREES**

<u>Exceptional Trees</u>- means a tree or group of trees that because of its unique historical, <u>ecological</u> or aesthetic value constitutes an important community resource. A tree that is rare or exceptional by virtue of its size, species, condition, cultural/historical importance, age, and/or contribution as part of a tree grove. Trees with a diameter of more than 36 inches, or with a diameter that is equal to or greater than the diameter listed in the Exceptional Tree Table shown in MICC 19.16 under Tree, Exceptional.

List the total number of trees for each category and the tree identification numbers from the arborist report.

Number of trees 36"	or greater	8
List tree numbers:	8118, 8261, 8183, 8314, 8325, 8233, 8318, 8356.	
Number of trees 24"	or greater (including 36" or greater)	17
List tree numbers: 8124, 8274, 8262.	8261, 8183, 8314, 8325, 8233, 8118, 8318, 8356, 8277, 8127, 8321	, 8126, 8276, 8175,
Number of trees from	n Exceptional Tree Table (MICC 19.16)	11
List tree numbers:	8118, 8261, 8183, 8314, 8325, 8233, 8318, 8356, 8277, 8127	,8234

## LARGE REGULATED TREES

definition of an Exce	<u>es</u> - means any tree witn a alameter of 10 inches or more, and any tree ptional Tree.	tnat meets tne

List tree numbers:		
Number of Large Reg	gulated Trees in right of way proposed for <u>removal</u>	N/A
List tree numbers:		
Reason for removal:		
TREE REPLACEMENT		

Tree replacement- removed trees must be replaced based on the ratio in the table below. Replacement trees shall be conifers at least six feet tall and or deciduous at least one and one-half inches in diameter at base.

			Number of Tree
	Tree	Number of	Required for
Diameter of Removed Tree (measured 4.5'	replacement	Trees Proposed	Replacement Based
above ground)	Ratio	for Removal	on Size/Type
Less than 10"* N/A	1	N/A	N/A
10" up to 24"	2	12	24
Greater than 24" up to 36"	3	0	0
Greater than 36" and any Exceptional Tree	6	15	90
	TOTAL TREE	REPLACEMENTS	114

<sup>\*</sup>no replacement tree is needed if the tree fits all of the following;

Less than 10 inches in diameter, not an exceptional tree, and not a replacement tree from another tree permit. \*

Tree Protection Fencing: Tree Protection fencing should be erected prior to any site grading.

First, protect roots that lie in the path of construction. Approximately 90 to 95 percent of a tree's root system is in the top three feet of soil, and more than half is in the top one foot. Construction activities should be avoided in this area. Protect as much of the area beyond the tree's dripline as possible. Some healthy trees survive after losing half of their roots. However, other species are extremely sensitive to root damage even outside the dripline.

Do not disturb the Critical Root Zone (CRZ). The CRZ is defined by its "critical root radius." It is more accurate than the dripline for determining the CRZ of trees growing in forests or that have narrow growth habits. To calculate critical root radius, measure the tree's diameter (DBH) in inches, 4.5 feet above the ground. For each inch, allow for 1 to 1.5 feet of critical root radius. If a tree's DBH is ten inches, its critical root radius is 10 to 15 feet.

In addition to the CRZ, it is important to determine the Limits of Disturbance (LOD) for preserved trees. Generally, this is approximating the CRZ however in previously excavated areas around the dripline the LOD may be smaller, or in the case of a tree situated on a slope the LOD may be larger. The determination of LOD is also subject to the tree species. Some tree species do better than others after root disturbance.

Tree protection is advised throughout the duration of any construction activities whenever the critical root zone or leaf canopy may be encroached upon by such activities.

The Critical Root Zone (CRZ) or LOD should be protected with fencing adequate to hinder access to people, vehicles and equipment. Fencing detail is provided. It should consist of continuous 4 ft. high temporary chain-link fencing with posts sec at 10' on center or polyethylene laminar safety fencing or similar. The fencing must contain fencing signage detailing that the tree protection area cannot be trespassed on.

Soil compaction is one of the most common killers of urban trees. Stockpiled materials, heavy machinery and excessive foot traffic damage soil structure and reduce soil pore space. The effected tree roots suffocate. When construction takes place close to the protected CRZ, cover the site with 4 inches of bark to reduce soil compaction.

Tree Protection fencing must be erected prior to soil excavation, boring, grading or fill operations. It is erected at the LOD. If it is necessary to run utilities within the LOD, the utilities should be combined into one cut, as practical. Trenching is not allowed in the LOD. In these areas boring or tunneling techniques should be used. If roots greater than 1" diameter near the LOD are damaged or torn, it is necessary to hand trim them to a clean cut. Any roots that are exposed during construction should be covered with soil as soon as possible.

During drought conditions, trees must be adequately watered. The site should be visited regularly by a qualified ISA Certified Arborist to ensure the health of the trees. Tree protection fencing is the last item to be removed from the site after construction is completed.

After construction has been completed, evaluate the remaining trees. Look for signs and symptoms of damage or stress. It may take several years for severe problems to appear.

If fencing around portions of the CRZ of a tree to be retained are not practical to erect due to construction or obstacles, tree protection fencing should be placed three feet laterally from the obstruction (ex. three feet back of a curb, building, or other existing or planned permanent infrastructure.

## Glossary:

ANSI A300: American National Standards Institute (ANSI) standards for tree care

Chlorotic: discoloration caused by lack of chlorophyll in the foliage

Conifer: A tree that bears cones and has evergreen needles or scales

Crown: the above ground portion of the tree comprised of branches and their foliage

Crown raise pruning: a pruning technique where the lower branches are removed, thus raising the overall height of the crown from the ground

DBH or DSH: diameter at breast or standard height; the diameter of the trunk measured 54 inches (4.5 feet) above grade

Deciduous: tree or other plant that loses its leaves annually and remains leafless generally during the cold season

Epicormic: arising from latent or adventitious buds

Evergreen: tree or plant that keeps its needles or leaves year round; this means for more than one growing season

Increment: the amount of new wood fiber added to a tree in a given period, normally one year.

ISA: International Society of Arboriculture

Landscape function: the environmental, aesthetic, or architectural functions that a plant can have

Lateral: secondary or subordinate branch

Limits of disturbance: The boundary of minimum protection around a tree, the area that cannot be encroached upon without possible permanent damage to the tree. It is a distance determined by a qualified professional and is based on the age of the tree, its health, the tree species tolerance to disruption and the type of disturbance. It also considers soil and environmental condition and previous impacts. It is unique to each tree in its location.

Limited visual assessment: a visual assessment from a specified perspective such as foot, vehicle, or aerial (airborne) patrol of an individual tree or a population of trees near specified targets to identify specified conditions or obvious defects (ISA 2013)

Live crown ratio: the percentage of living tissue in the canopy versus the tree's height. It is a good indicator of overall tree health and the trees growing conditions. Trees with less than a 30% Crown ratio often lack the necessary quantity of photosynthetic material necessary to sustain the roots; consequently, the tree may exhibit low vigor and poor health.

Monitoring: keeping a close watch; performing regular checks or inspections

Owner/manager: the person or entity responsible for tree management or the controlling authority that regulates tree management

Pathogen: causal agent of disease

Phototropic growth: growth toward light source or stimulant

ROW: Right-of-way; generally referring to a tree that is located offsite on a city easement

Reaction wood: Specialized secondary xylem which develops in response to a lean or similar mechanical stress, it serves to help restore the stem to a vertical position

- Self-corrected lean: a tree whose trunk is at an angle to the grade but whose trunk and canopy changes to become upright/vertical
- Significant tree: a tree measuring a specific diameter determined by the municipality the tree grows in.

  Some municipalities deem that only healthy trees can be significant, other municipalities consider both healthy and unhealthy trees of a determined diameter to be significant
- Snag: a tree left partially standing for the primary purpose of providing habitat for wildlife
- Soil structure: the size of particles and their arrangement; considers the soil, water, and air space
- Sounding: process of striking a tree with a mallet or other appropriate tool and listening for tones that indicate dead bark, a thin layer of wood outside a cavity, or cracks in wood
- Structural defects: flaws, decay, or other faults in the trunk, branches, or root collar of a tree, which may lead to failure; may be genetic, or environmental
- Tree credit: A number assigned to a tree by a municipality that may be equal to the diameter of the tree or a numerical count of the tree, or related to diameter by a factor conveyed in a table of the municipal code
- Trunk area: the cross-sectional area of the trunk based upon measurement at 54 inches (4.5 ft.) above grade
- Visual Tree Assessment (VTA): method of evaluating structural defects and stability in trees by noting the pattern of growth. Developed by Claus Mattheck (Harris, et al 1999) detailed visual inspection of a tree and surrounding site that may include the use of simple tools. It requires that a tree risk assessor walk completely around the tree trunk looking at the site, aboveground roots, trunk, and branches (ISA 2013)

## **Assumptions and Limiting Conditions**

- 1. Any legal description provided to the consultant/appraiser is assumed to be correct. Any titles and ownerships to any property are assumed to be good and marketable. No responsibility is assumed for matters legal in character. Any and all property is appraised or evaluated as thou free and clear, under responsible ownership and competent management.
- 2. It is assumed that any property is not in violation of any applicable codes, ordinances, statutes or other governmental regulations.
- 3. Care has been taken to obtain all information from reliable sources. All data has been verified insofar as possible; however, the consultant/appraiser can neither guarantee nor be responsible for the accuracy of information provided by others.
- 4. The consultant/appraiser shall not be required to give testimony or to attend court by reason of the report unless subsequent contractual arrangements are made including payment of an additional fee for such services as described in the fee schedule and contract of engagement.
- 5. Loss or alteration of any part of this report invalidates the entire report.
- 6. Possession of this report or a copy thereof does not imply right of publication or use for any purpose by any other than the person to whom it is addressed, without the prior expressed written or verbal consent of the consultant/appraiser.
- 7. Neither all nor any part of the contents of the report, nor copy thereof, shall be conveyed by anyone, including the client to the public through advertising, public relations, news, sales or other media, without the prior expressed written or verbal consent of the consultant/appraiser particularly as to value conclusions, identity of the consultant/appraiser, or any reference to any professional society or instate or to any initialed designation conferred upon the consultant/appraiser as stated in her qualification.
- The report and any values expressed herein represent the opinion of the consultant/appraiser, and the consultant's/appraiser's fee is in no way contingent upon the reporting of a specified value, a stipulated result, the occurrence of subsequent event, nor upon any finding to be reported.
- 9. Sketches, diagrams, graphs and photographs in this report, being intended as visual aid, are not necessarily to scale and should not be construed as engineering or architectural reports or survey.
- 10. Unless expressed otherwise: 1) information contained in this report covers only those items that were examined and reflects the condition of those items at the time of inspection; and 2: the inspection is limited to visual examination of accessible items without dissection, excavation, probing or coring. There is not warranty or guarantee, expressed or implied, that problems or deficiencies of the plants or property in question may not arise in the future.
